accept-lifetime

To set the time period during which the authentication key on a key chain is received as valid, use the **accept-lifetime** command in key chain key configuration mode. To revert to the default value, use the **no** form of this command.

accept-lifetime [local] *start-time* { **infinite** *end-time* | **duration** *seconds* } **no accept-lifetime**

Syntax Description	local	Specifies the time in local timezone.
	start-time	Beginning time that the key specified by the key command is valid to be received. The syntax can be either of the following:
		hh: mm: ss month date year
		hh:mm:ss date month year
		• <i>hh</i> : Hours
		• <i>mm</i> : Minutes
		• ss: Seconds
		• <i>month</i> : First three letters of the month
		• <i>date</i> : Date (1-31)
		• <i>year</i> : Year (four digits)
		The default start time and the earliest acceptable date is January 1, 1993.
	infinite	Key is valid to be received from the <i>start-time</i> value on.
	end-time	Key is valid to be received from the <i>start-time</i> value until the <i>end-time</i> value. The syntax is the same as that for the <i>start-time</i> value. The <i>end-time</i> value must be after the <i>start-time</i> value. The default end time is an infinite time period.
	duration seconds	Length of time (in seconds) that the key is valid to be received. The range is from 1 to 2147483646.
Command Default	The authentication k the ending time is in	ey on a key chain is received as valid forever (the starting time is January 1, 1993, and finite).
Command Modes	Key chain key config	guration (config-keychain-key)
Command History	Release	Modification
	Cisco IOS XE Fuji	16.9.2 This command was introduced.
	Cisco IOS XE Benga	aluru 17.5.1 The new range of the duration keyword is from 1 to 2147483646.

Only DRP Agent, Enhanced Interior Gateway Routing Protocol (EIGRP), and Routing Information Protocol **Usage Guidelines** (RIP) Version 2 use key chains. Specify a start-time value and one of the following values: infinite, end-time, or duration seconds. We recommend running Network Time Protocol (NTP) or some other time synchronization method if you assign a lifetime to a key. If the last key expires, authentication will continue and an error message will be generated. To disable authentication, you must manually delete the last valid key. **Examples** The following example configures a key chain named chain1. The key named key1 will be accepted from 1:30 p.m. to 3:30 p.m. and will be sent from 2:00 p.m. to 3:00 p.m. The key named key2 will be accepted from 2:30 p.m. to 4:30 p.m. and will be sent from 3:00 p.m. to 4:00 p.m. The overlap allows for migration of keys or a discrepancy in the set time of the router. There is a 30-minute leeway on each side to handle time differences. Device(config) # interface GigabitEthernet1/0/1 Device (config-if) # ip rip authentication key-chain chain1 Device (config-if) # ip rip authentication mode md5 Device (config-if) # exit Device (config) # router rip Device (config-router) # network 172.19.0.0 Device (config-router) # version 2 Device (config-router) # exit Device (config) # key chain chain1 Device (config-keychain) # key 1 Device (config-keychain-key) # key-string key1 Device (config-keychain-key) # accept-lifetime 13:30:00 Jan 25 1996 duration 7200 Device (config-keychain-key) # send-lifetime 14:00:00 Jan 25 1996 duration 3600 Device (config-keychain-key) # exit Device(config-keychain) # key 2 Device(config-keychain) # key-string key2 Device (config-keychain) # accept-lifetime 14:30:00 Jan 25 1996 duration 7200 Device (config-keychain) # send-lifetime 15:00:00 Jan 25 1996 duration 3600 The following example configures a key chain named chain1 for EIGRP address-family. The key named key1 will be accepted from 1:30 p.m. to 3:30 p.m. and be sent from 2:00 p.m. to 3:00 p.m. The key named key2 will be accepted from 2:30 p.m. to 4:30 p.m. and be sent from 3:00 p.m. to 4:00 p.m. The overlap allows for migration of keys or a discrepancy in the set time of the router. There is a 30-minute leeway on each side to handle time differences. Related	Commands
---------	----------

Command	Description
key	Identifies an authentication key on a key chain.
key chain	Defines an authentication key-chain needed to enable authentication for routing protocols.
key-string (authentication)	Specifies the authentication string for a key.
send-lifetime	Sets the time period during which an authentication key on a key chain is valid to be sent.
show key chain	Displays authentication key information.

address-family ipv6 (OSPF)

To enter the address family configuration mode for configuring routing sessions, such as Open Shortest Path First (OSPF), that uses the standard IPv6 address prefixes, use the **address-family ipv6** command in the router configuration mode. To disable the address family configuration mode, use the **no** form of this command.

address-family ipv6 [unicast][vrf vrf-name] no address-family ipv6 [unicast][vrf vrf-name]

Syntax Description	unicast	(Optional) Specifies the IPv	6 unicast address prefixes.	
	vrf	(Optional) Specifies all the V table for an IPv6 address.	VPN routing and forwarding (VRF) instance tables or a sp	pecific VRF
	vrf-name	(Optional) A specific VRF t	table for an IPv6 address.	
Command Default	IPv6 addre are configu	-	nicast address prefixes are the default when the IPv6 add	ress prefixes
Command Modes	Router cor	nfiguration (config-router)		
Command History	Release			Modification
	Cisco IOS	S XE Fuji 16.9.2		This command w
Usage Guidelines		• • •	ces the router in address family configuration mode (pro onfigure routing sessions that use the standard IPv6 addr	1
Examples	The follow	ving example shows how to pl	ace the router in address family configuration mode:	
	Device> enable Device# configure terminal Device(config)# router ospfv3 1 Device(config-router)# address-family ipv6 unicast Device(config-router-af)#			
Related Commands	Command	I	Description	
	router os	spfv3	Enters OSPFv3 router configuration mod	le.

area nssa

To configure a not-so-stubby area (NSSA), use the **area nssa** command in router address family topology or router configuration mode. To remove the NSSA distinction from the area, use the **no** form of this command.

area nssa commandarea *area-id* nssa [no-redistribution] [default-information-originate [metric] [metric-type]] [no-summary] [nssa-only] no area *area-id* nssa [no-redistribution] [default-information-originate [metric] [metric-type]] [no-summary] [nssa-only]

Syntax Description	<i>area-id</i> Identifier for the stub area or NSSA. The identifier can be specified as a decimal value or an IP address.			
	no-redistribution (Optional) Used when the router is an NSSA Area Border Router (ABR) and you want the redistribute command to import routes only into the normal areas, but not into the NSSA area.			
	default-information- originate	(Optional) Used to generate a Type 7 default into the NSSA area. This keyword takes effect only on the NSSA ABR or the NSSA Autonomous System Boundary Router (ASBR).		
	metric	(Optional) Specifies the OSPF default metric.		
	metric-type	(Optional) Specifies the OSPF metric type for default routes.		
	no-summary	(Optional) Allows an area to be an NSSA but not have summary routes injected into it.		
	nssa-only	nssa-only (Optional) Limits the default advertisement to this NSSA area by setting propagate (P) bit in the type-7 LSA to zero.		
Command Default	No NSSA area is defined.			
Command Modes	Router address family topolo	ogy configuration (config-r	router-af-topology) Router configuration (config-router)	
Command History	Release		Modification	
	Cisco IOS XE Fuji 16.9.2		This command was introduced.	
Usage Guidelines	To remove the specified area from the software configuration, use the no area <i>area-id</i> command (with no other keywords). That is, the no area <i>area-id</i> command removes all area options, including area authentication , area default-cost , area nssa , area range , area stub , and area virtual-link .			
	Release 12.2(33)SRB			
	If you plan to configure the Multi-Topology Routing (MTR) feature, you need to enter the area nssa command in router address family topology configuration mode in order for this OSPF router configuration command to become topology-aware.			
Examples	The following example makes area 1 an NSSA area:			

router ospf 1
redistribute rip subnets
network 172.19.92.0 0.0.0.255 area 1
area 1 nssa

Related Commands

mmands	Command	Description
	redistribute	Redistributes routes from one routing domain into another routing domain.

area virtual-link

To define an Open Shortest Path First (OSPF) virtual link, use the **area virtual-link** command in router address family topology, router configuration, or address family configuration mode. To remove a virtual link, use the **no** form of this command.

area area-id virtual-link router-id authentication key-chain chain-name [hello-interval seconds] [retransmit-interval seconds] [transmit-delay seconds] [dead-interval seconds] [ttl-security hops hop-count]

no area area-id virtual-link router-id authentication key-chain chain-name

Syntax Description Table 1:

area-id	Area ID assigned to the virtual link. This can be either a decimal value or a valid IPv6 prefix. There is no default.
router-id	Router ID associated with the virtual link neighbor. The router ID appears in the show ip ospf or show ipv6 display command. There is no default.
authentication	Enables virtual link authentication.
key-chain	Configures a key-chain for cryptographic authentication keys.
chain-name	Name of the authentication key that is valid.
hello-interval seconds	(Optional) Specifies the time (in seconds) between the hello packets that the Cisco IOS software sends on an interface. The hello interval is an unsigned integer value to be advertised in the hello packets. The value must be the same for all routers and access servers attached to a common network. The range is from 1 to 8192. The default is 10.
retransmit-interval seconds	(Optional) Specifies the time (in seconds) between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface. The retransmit interval is the expected round-trip delay between any two routers on the attached network. The value must be greater than the expected round-trip delay. The range is from 1 to 8192. The default is 5.
transmit-delay seconds	(Optional) Specifies the estimated time (in seconds) required to send a link-state update packet on the interface. The integer value that must be greater than zero. LSAs in the update packet have their age incremented by this amount before transmission. The range is from 1 to 8192. The default value is 1.

	dead-interval seconds	(Optional) Specifies the time (in seconds) that hello packets are not seen before a neighbor declares the router down. The dead interval is an unsigned integer value. The default is four times the hello interval, or 40 seconds. As with the hello interval, this value must be the same for all routers and access servers attached to a common network.			
	ttl-security hops hop-count	(Optional) Configures Time-to-Live (TTL) security on a virtual link. The <i>hop-count</i> argument range is from 1 to 254.			
Command Default	No OSPF virtual link is defined.				
Command Modes	Router address family topology configuration (config-router-af-topology) Router configuration (config-router) Address family configuration (config-router-af)				
Command History	Release	Modification			
	Cisco IOS XE Fuji 16.9.2	This command was introduced.			
Usage Guidelines	In OSPF, all areas must be connected to a backbone area. A lost connection to the backbone can be repaired by establishing a virtual link.				
	The shorter the hello interval, the faster topological changes will be detected, but more routing traffic will ensue. The setting of the retransmit interval should be conservative, or needless retransmissions will result. The value should be larger for serial lines and virtual links.				
	You should choose a transmit delay value that considers the transmission and propagation delays for the interface.				
	To configure a virtual link in OSPF for IPv6, you must use a router ID instead of an address. In OSPF for IPv6, the virtual link takes the router ID rather than the IPv6 prefix of the remote router.				
	Use the ttl-security hops <i>hop-count</i> keywords and argument to enable checking of TTL values on OSPF packets from neighbors or to set TTL values sent to neighbors. This feature adds an extra layer of protection to OSPF.				
	Note In order for a virtual link to be properly configured, each virtual link neighbor must include the transit area ID and the corresponding virtual link neighbor router ID. To display the router ID, use the show ip ospf or the show ipv6 ospf command in privileged EXEC mode.				
	-	tware configuration, use the no area <i>area-id</i> command (with no <i>a-id</i> command removes all area options, such as area default-cos			

area nssa, area range, area stub, and area virtual-link.

Release 12.2(33)SRB

If you plan to configure the Multitopology Routing (MTR) feature, you need to enter the **area virtual-link** command in router address family topology configuration mode in order for this OSPF router configuration command to become topology-aware.

Examples The following example establishes a virtual link with default values for all optional parameters:

Device(config)# **ipv6 router ospf 1** Device(config)# **log-adjacency-changes** Device(config)# **area 1 virtual-link 192.168.255.1**

The following example establishes a virtual link in OSPF for IPv6:

```
Device(config) # ipv6 router ospf 1
Device(config) # log-adjacency-changes
Device(config) # area 1 virtual-link 192.168.255.1 hello-interval 5
```

The following example shows how to configure TTL security for a virtual link in OSPFv3 for IPv6:

```
Device(config)# router ospfv3 1
Device(config-router)# address-family ipv6 unicast vrf vrf1
Device(config-router-af)# area 1 virtual-link 10.1.1.1 ttl-security hops 10
```

The following example shows how to configure the authentication using a key chain for virtual-links:

Device (config) # area 1 virtual-link 192.168.255.1 authentication key-chain ospf-chain-1

Related Commands	Command	Description
	area	Configures OSPFv3 area parameters.
	show ip ospf	Enables the display of general information about OSPF routing processes.
	show ipv6 ospf	Enables the display of general information about OSPF routing processes.
	ttl-security hops	Enables checking of TTL values on OSPF packets from neighbors or setting TTL values sent to neighbors.

authentication (BFD)

To configure authentication in a Bidirectional Forwarding Detection (BFD) template for single hop sessions, use the **authentication** command in BFD configuration mode. To disable authentication in BFD template for single-hop sessions, use the **no** form of this command

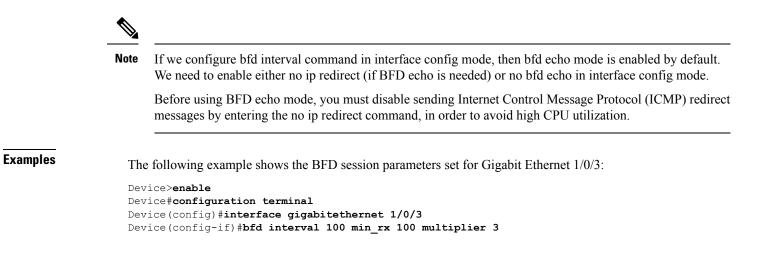

authentication authentication-type keychain keychain-name no authentication authentication-type keychain keychain-name

Syntax Description	authentication-type	Authentication type. Valid value sha-1.	es are md5, meticulous-md5, meticulous-sha1, and	
	keychain <i>keychain-name</i> Configures an authentication key chain with the specified name. The maximum number of characters allowed in the name is 32.			
Command Default	Authentication in BFD	template for single hop sessions is	not enabled.	
Command Modes	BFD configuration (cor	nfig-bfd)		
Command History	Release	Modification		
	Cisco IOS XE Fuji 16.9.2	This command was introduced.		
Usage Guidelines	-	hentication must be configured on e	We recommend that you configure authentication each BFD source-destination pair, and authentication	
Examples	The following example shows how to configure authentication for the template1 BFD single-hop template:			
		a terminal cemplate single-hop template1 authentication sha-1 keychain		

To set the baseline Bidirectional Forwarding Detection (BFD) session parameters on an interface, use the **bfd** interface configuration mode. To remove the baseline BFD session parameters, use the **no** form of this command

bfd interval milliseconds **min_rx** milliseconds **multiplier** multiplier-value **no bfd interval** milliseconds **min_rx** milliseconds **multiplier** multiplier-value

Syntax Description	interval <i>milliseconds</i> Specifies the rate, in milliseconds, at which BFD control packets will be sent to BFD peers. The valid range for the milliseconds argument is from 50 to 9999.				
	min_rx milliseconds	<i>milliseconds</i> Specifies the rate, in milliseconds, at which BFD control packets will be expected to be received from BFD peers. The valid range for the milliseconds argument is from 50 to 9999.			
	multiplier multiplier-value	Specifies the number of consecutive BFD control packets that must be missed from a BFD peer before BFD declares that the peer is unavailable and the Layer 3 BFD peer is informed of the failure. The valid range for the multiplier-valueargument is from 3 to 50.			
Command Default	No baseline BFD session	n parameters are set.			
Command Modes	Interface configuration (config-if)			
Command History	Release	Modification			
	Cisco IOS XE Fuji 16.9.2	This command was introduced.			
Usage Guidelines	The bfd command can be	e configured on SVI, Ethernet and port-channel interfaces.			
	If BFD runs on a port channel interface, BFD has a timer value restriction of 750 * 3 milliseconds.				
	The bfd interval configuration is not removed when:				
	• an IPv4 address is removed from an interface				
	• an IPv6 address is removed from an interface				
	• IPv6 is disabled from an interface				
	• an interface is shutdown				
	• IPv4 CEF is disabled globally or locally on an interface				
	• IPv6 CEF is disabled globally or locally on an interface				
	The bfd interval configu	ration is removed when the subinterface on which its is configured is removed.			

bfd all-interfaces

To enable Bidirectional Forwarding Detection (BFD) for all interfaces participating in the routing process, use the **bfd all-interfaces** command in router configuration or address family interface configuration mode. To disable BFD for all neighbors on a single interface, use the **no** form of this command

bfd all-interfaces no bfd all-interfaces

Command Default BFD is disabled on the interfaces participating in the routing process.

Command Modes Router configuration (config-router)

Command History	Release	Modification
	Cisco IOS XE Fuji 16.9.2	This command was introduced.

Usage Guidelines To enable BFD for all interfaces, enter the bfd all-interfaces command in router configuration mode

Examples The following example shows how to enable BFD for all Enhanced Interior Gateway Routing Protocol (EIGRP) neighbors:

```
Device>enable
Device#configuration terminal
Device(config)#router eigrp 123
Device(config-router)#bfd all-interfaces
Device(config-router)#end
```

The following example shows how to enable BFD for all Intermediate System-to-Intermediate System (IS-IS) neighbors:

Device> enable
Device#configuration terminal
Device(config)#router isis tag1
Device(config-router)#bfd all-interfaces
Device(config-router)#end

bfd check-ctrl-plane-failure

To enable Bidirectional Forwarding Detection (BFD) control plane failure checking for the Intermediate System-to-Intermediate System (IS-IS) routing protocol, use the **bfd check-control-plane-failure** command in router configuration mode. To disable control plane failure detection, use the **no** form of this command

bfd check-ctrl-plane-failure no bfd check-ctrl-plane-failure

Syntax Description	This command h	nas no arguments	or keywords.
--------------------	----------------	------------------	--------------

Command Default BFD control plane failure checking is disabled.

Command Modes Router configuration (config-router)

Command History	Release	Modification
	Cisco IOS XE Fuji 16.9.2	This command was introduced.

Usage Guidelines The bfd check-o

The bfd check-ctrl-plane-failure command can be configured for an IS-IS routing process only. The command is not supported on other protocols.

When a switch restarts, a false BFD session failure can occur, where neighboring routers behave as if a true forwarding failure has occurred. However, if the bfd check-ctrl-plane-failure command is enabled on a switch, the router can ignore control plane related BFD session failures. We recommend that you add this command to the configuration of all neighboring routers just prior to a planned router restart, and that you remove the command from all neighboring routers when the restart is complete.

Examples

The following example enables BFD control plane failure checking for the IS-IS routing protocol:

Device>enable Device#configuration terminal Device(config)#router isis Device(config-router)#bfd check-ctrl-plane-failure Device(config-router)#end

bfd echo

To enable Bidirectional Forwarding Detection (BFD) echo mode, use the **bfd echo** command in interface configuration mode. To disable BFD echo mode, use the no form of this command bfd echo no bfd echo This command has no arguments or keywords. Syntax Description BFD echo mode is enabled by default if BFD is configured using bfd interval command in interface **Command Default** configuration mode. Interface configuration (config-if) **Command Modes Command History** Release Modification Cisco IOS XE Fuji 16.9.2 This command was introduced. Echo mode is enabled by default. Entering the **no bfd echo** command without any keywords turns off the **Usage Guidelines** sending of echo packets and signifies that the switch is unwilling to forward echo packets received from BFD neighbor switches. When echo mode is enabled, the desired minimum echo transmit interval and required minimum transmit interval values are taken from the **bfd interval** milliseconds **min_rx** milliseconds parameters, respectively. Note Before using BFD echo mode, you must disable sending Internet Control Message Protocol (ICMP) redirect messages by entering the **no ip redirects** command, in order to avoid high CPU utilization. **Examples** The following example configures echo mode between BFD neighbors: Device>enable Device#configuration terminal Device (config) #interface GigabitEthernet 1/0/3 Device (config-if) #bfd echo The following output from the show bfd neighbors details command shows that the BFD session neighbor is up and using BFD echo mode. The relevant command output is shown in bold in the output. Device#show bfd neighbors details OurAddr NeighAddr LD/RD RH/RS Holdown(mult) State Int 172.16.1.2 172.16.1.1 1/6 0 (3) Up Fa0/1 Up Session state is UP and using echo function with 100 ms interval. Local Diag: 0, Demand mode: 0, Poll bit: 0 MinTxInt: 1000000, MinRxInt: 1000000, Multiplier: 3 Received MinRxInt: 1000000, Received Multiplier: 3 Holdown (hits): 3000(0), Hello (hits): 1000(337) Rx Count: 341, Rx Interval (ms) min/max/avg: 1/1008/882 last: 364 ms ago Tx Count: 339, Tx Interval (ms) min/max/avg: 1/1016/886 last: 632 ms ago Registered protocols: EIGRP

bfd slow-timers

To configure the Bidirectional Forwarding Detection (BFD) slow timers value, use the **bfd slow-timers** command in interface configuration mode. To change the slow timers used by BFD, use the **no** form of this command

bfd slow-timers [milliseconds] **no bfd slow-timers**

Command Default The BFD slow timer value is 1000 milliseconds

Command Modes Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Fuji 16.9.2	This command was introduced.

Examples

The following example shows how to configure the BFD slow timers value to 14,000 milliseconds:

Device (config) #bfd slow-timers 14000

The following output from the show bfd neighbors details command shows that the BFD slow timers value of 14,000 milliseconds has been implemented. The values for the MinTxInt and MinRxInt will correspond to the configured value for the BFD slow timers. The relevant command output is shown in bold.

```

            Min Echo interval: 50000
```

Note

• If the BFD session is down, then the BFD control packets will be sent with the slow timer interval.

• If the BFD session is up, then if echo is enabled, then BFD control packets will be sent in negotiated slow timer interval and echo packets will be sent in negotiated configured BFD interval. If echo is not enabled, then BFD control packets will be sent in negotiated configured interval.

bfd template

To create a Bidirectional Forwarding Detection (BFD) template and to enter BFD configuration mode, use the **bfd-template** command in global configuration mode. To remove a BFD template, use the **no** form of this command

bfd template *template-name* **no bfd template** *template-name*

Command Default A BFD template is not bound to an interface.

Command Modes Interface configuration (config-if)

Command History	Release	Modification	
	Cisco IOS XE Fuji 16.9.2	This command was introduced.	

Usage Guidelines Even if you have not created the template by using the bfd-template command, you can configure the name of the template under an interface, but the template is considered invalid until you define the template. You do not have to reconfigure the template name again. It becomes valid automatically.

Examples	Device> enable
	Device#configuration terminal
	Device(config) #interface Gigabitethernet 1/3/0
	Device(config-if) #bfd template template1

bfd-template single-hop

To bind a single hop Bidirectional Forwarding Detection (BFD) template to an interface, use the **bfd template** command in interface configuration mode. To unbind single-hop BFD template from an interface, use the **no** form of this command

bfd-template single-hop *template-name* **no bfd-template single-hop** *template-name*

Syntax Description	single-hop Creates the single-hop BFD template.	
	template-name Template name.	
Command Default	A BFD template does not exist.	
Command Modes	Global configuration (config)	
Command History	Release Modification	
	Cisco IOS XE Fuji 16.9.2 This command was introduced.	
Usage Guidelines	The bfd-template command allows you to create a BFD template and places the device in BFD configuration mode. The template can be used to specify a set of BFD interval values. BFD interval values specified as part of the BFD template are not specific to a single interface.	
Examples	The following example shows how to create a BFD template and specify BFD interval values:	
	Device>enable Device#configuration terminal Device(config)#bfd-template single-hop node1 Device(bfd-config)#interval min-tx 100 min-rx 100 multiplier 3 Device(bfd-config)#echo	
	The following example shows how to create a BFD single-hop template and configure BFD interval values and an authentication key chain:	
	Device> enable Device#configuration terminal Device(config)#bfd-template single-hop template1 Device(bfd-config)#interval min-tx 200 min-rx 200 multiplier 3 Device(bfd-config)#authentication keyed-sha-1 keychain bfd_singlehop	

explicitly.

default-information originate (OSPF)

To generate a default external route into an Open Shortest Path First (OSPF) routing domain, use the **default-information originate** command in router configuration or router address family topology configuration mode. To disable this feature, use the **no** form of this command.

default-information originate [always] [metric *metric-value*] [metric-type *type-value*] [route-map *map-name*] no default-information originate [always] [metric *metric-value*] [metric-type *type-value*] [route-map

no default-information originate [always] [metric metric-value] [metric-type type-value] [route-map map-name]

Syntax Description	always (Optional) Always advertises the default route regardless of whether the so has a default route.		ses the default route regardless of whether the software
		map is used. When a by OSPF is not bou	rd includes the following exception when the route a route map is used, the origination of the default route and to the existence of a default route in the routing rs keyword is ignored.
	metric metric-value	do not specify a value usin	generating the default route. If you omit a value and g the default-metric router configuration command, 10. The value used is specific to the protocol.
	metric-type <i>type-value</i>		pe associated with the default route that is advertised aain. It can be one of the following values:
		• Type 1 external route.	
		• Type 2 external route.	
		The default is type 2 extern	nal route.
	route-map map-name	(Optional) The routing pro satisfied.	cess will generate the default route if the route map is
Command Default	This command is disabled	l by default. No default exte	rnal route is generated into the OSPF routing domain.
Command Modes	Router configuration (configuration)	fig-router) Router address fai	mily topology configuration (config-router-af-topology)
Command History	Cisco IOS XE Fuji 16.9.2	2	This command was introduced.
Usage Guidelines	Whenever you use the redistribute or the default-information router configuration command to redistribute routes into an OSPF routing domain, the Cisco IOS software automatically becomes an Autonomous System Boundary Router (ASBR). However, an ASBR does not, by default, generate a default route into the OSPF routing domain. The software must still have a default route for itself before it generates one, except when you have specified the always keyword.		
	When a route map is used, the origination of the default route by OSPF is not bound to the existence of a default route in the routing table.		ult route by OSPF is not bound to the existence of a

Release 12.2(33)SRB

If you plan to configure the Multi-Topology Routing (MTR) feature, you need to enter the **default-information originate**command in router address family topology configuration mode in order for this OSPF router configuration command to become topology-aware.

Examples

The following example specifies a metric of 100 for the default route that is redistributed into the OSPF routing domain and specifies an external metric type of 1:

```
router ospf 109
redistribute eigrp 108 metric 100 subnets
default-information originate metric 100 metric-type 1
```

Related	Commands
---------	----------

Command	Description
default-information	Accepts exterior or default information into Enhanced Interior Gateway Routing Protocol (EIGRP) processes.
default-metric	Sets default metric values for routes.
redistribute (IP)	Redistributes routes from one routing domain into another routing domain.

distance (OSPF)

To define an administrative distance, use the **distance** command in router configuration mode or VRF configuration mode. To remove the **distance** command and restore the system to its default condition, use the **no** form of this command.

distance weight [ip-address wildcard-mask [access-list name]] no distance weight ip-address wildcard-mask [access-list-name]

Syntax Description	weightAdministrative distance. Range is 10 to 255. Used alone, the weight argument specific default administrative distance that the software uses when no other specification exit for a routing information source. Routes with a distance of 255 are not installed in th routing table. The table in the "Usage Guidelines" section lists the default administrative distances.			
	ip-address	(Optional) IP address in four-p	art dotted-decimal notation.	
	wildcard-mask	(Optional) Wildcard mask in four-part, dotted-decimal format. A bit set to 1 in the <i>wildcard-mask</i> argument instructs the software to ignore the corresponding bit in the address value.		
	access-list-name	(Optional) Name of an IP acce	ss list to be applied to incoming routing updates.	
Command Default	If this command is not specified, the administrative distance is the default. The table in the "Usage Guidelines" section lists the default administrative distances.			
Command Modes	Router configura	tion (config-router)		
	VRF configuration (config-vrf)			
Command History	Release		Modification	
	Cisco IOS XE F	uji 16.9.2	This command was introduced.	
Usage Guidelines			p associated with a task group that includes the appropriate you from using a command contact your AAA administrator	
	An administrative distance is an integer from 10 to 255. In general, the higher the value, the lower the rating. An administrative distance of 255 means that the routing information source cannot be trusted and should be ignored. Weight values are subjective; no quantitative method exists for choosing weight			
If an access list is used with this command, it is applied when a network is being inserted table. This behavior allows you to filter networks based on the IP prefix supplying the ro For example, you could filter possibly incorrect routing information from networking dev administrative control.		based on the IP prefix supplying the routing information.		
	The order in which you enter distance commands can affect the assigned administrative distance in the "Examples" section. The following table lists default administrative distances.			

Table 2: Default Administrative Distances

Rate Source	Default Distance
Connected interface	0
Static route out on interface	0
Static route to next hop	1
EIGRP summary route	5
External BGP	20
Internal EIGRP	90
OSPF	110
IS-IS	115
RIP version 1 and 2	120
External EIGRP	170
Internal BGP	200
Unknown	255

Task ID

Task ID	Operations
ospf	read, write

Examples

In the following example, the **router ospf** command sets up Open Shortest Path First (OSPF) routing instance 1. The first **distance** command sets the default administrative distance to 255, which instructs the software to ignore all routing updates from networking devices for which an explicit distance has not been set. The second **distance** command sets the administrative distance for all devices on the network 192.168.40.0 to 90.

```
Device#configure terminal
Device(config)#router ospf 1
Device(config-ospf)#distance 255
Device(config-ospf)#distance 90 192.168.40.0 0.0.0.255
```

Related Commands

ds	Command	Description
	0.	Allows the use of external, internal, and local administrative distances that could be a better route to a BGP node.
	distance ospf	Allows the use of external, internal, and local administrative distances that could be a better route to an OSPF node.

Command	Description
router ospf	Configures the OSPF routing process.

Command Default

eigrp log-neighbor-changes

To enable the logging of changes in Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor adjacencies, use the eigrp log-neighbor-changes command in router configuration mode, address-family configuration mode, or service-family configuration mode. To disable the logging of changes in EIGRP neighbor adjacencies, use the noform of thiscommand.

eigrp log-neighbor-changes no eigrp log-neighbor-changes

Syntax Description	This command has no arguments or keywords.
Command Default	Adjacency changes are logged.

Router configuration (config-router) Address-family configuration (config-router-af) Service-family **Command Modes** configuration (config-router-sf)

Command History	Release	Modification
	Cisco IOS XE Fuji 16.9.2	This command was introduced.

This command enables the logging of neighbor adjacency changes to monitor the stability of the routing **Usage Guidelines** system and to help detect problems. Logging is enabled by default. To disable the logging of neighbor adjacency changes, use the **no** form of this command.

To enable the logging of changes for EIGRP address-family neighbor adjacencies, use the eigrp log-neighbor-changes command in address-family configuration mode.

To enable the logging of changes for EIGRP service-family neighbor adjacencies, use the eigrp log-neighbor-changescommand in service-family configuration mode.

Examples The following configuration disables logging of neighbor changes for EIGRP process 209:

```
Device (config) # router eigrp 209
Device(config-router) # no eigrp log-neighbor-changes
```

The following configuration enables logging of neighbor changes for EIGRP process 209:

Device (config) # router eigrp 209 Device (config-router) # eigrp log-neighbor-changes

The following example shows how to disable logging of neighbor changes for EIGRP address-family with autonomous-system 4453:

```
Device (config) # router eigrp virtual-name
Device(config-router)# address-family ipv4 autonomous-system 4453
Device(config-router-af)# no eigrp log-neighbor-changes
Device (config-router-af) # exit-address-family
```

The following configuration enables logging of neighbor changes for EIGRP service-family process 209:

```
Device(config)# router eigrp 209
Device(config-router)# service-family ipv4 autonomous-system 4453
Device(config-router-sf)# eigrp log-neighbor-changes
Device(config-router-sf)# exit-service-family
```

Related	Commands	
---------	----------	--

Command	Description	
address-family (EIGRP)	Enters address-family configuration mode to configure an EIGRP routing instance.	
exit-address-family	Exits address-family configuration mode.	
exit-service-family	Exits service-family configuration mode.	
router eigrp	Configures the EIGRP routing process.	
service-family	Specifies service-family configuration mode.	

eigrp log-neighbor-warnings

To enable the logging of Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor warning messages, use the **eigrp log-neighbor-warnings** command in router configuration mode, address-family configuration mode, or service-family configuration mode. To disable the logging of EIGRP neighbor warning messages, use the **no** form of this command.

eigrp log-neighbor-warnings [seconds] no eigrp log-neighbor-warnings

Syntax Description	<i>seconds</i> (Optional) The time interval (in seconds) between repeated neighbor warning messages. The range is from 1 to 65535. The default is 10.			
Command Default	Neighbor warning messages are logged at 10-seco	nd intervals.		
Command Modes	Router configuration (config-router) Address-family configuration (config-router-af) Service-family configuration (config-router-sf)			
Command History	Release	Modification		
	Cisco IOS XE Fuji 16.9.2	This command was introduced.		
Usage Guidelines	When neighbor warning messages occur, they are logged by default. With this command, you can disable and enable neighbor warning messages, and you can configure the interval between repeated neighbor warning messages.			
	To enable the logging of warning messages for an EIGRP address family, use the eigrp log-neighbor-warnings command in address-family configuration mode.			
	To enable the logging of warning messages for an EIGRP service family, use the eigrp log-neighbor-warnings command in service-family configuration mode.			
Examples	The following command will log neighbor warning messages for EIGRP process 209 and repeat the warning messages in 5-minute (300 seconds) intervals:			
	Device(config)# router eigrp 209 Device(config-router)# eigrp log-neighbor-warnings 300			
	The following example logs neighbor warning messages for the service family with autonomous system number 4453 and repeats the warning messages in five-minute (300 second) intervals:			
	Device(config)# router eigrp virtual-name Device(config-router)# service-family ipv4 autonomous-system 4453 Device(config-router-sf)# eigrp log-neighbor-warnings 300			
	The following example logs neighbor warning messages for the address family with autonomous system number 4453 and repeats the warning messages in five-minute (300 second) intervals:			

Device(config) # router eigrp virtual-name

Device(config-router)# address-family ipv4 autonomous-system 4453 Device(config-router-af)# eigrp log-neighbor-warnings 300

Related Commands	Command	Description
	address-family (EIGRP)	Enters address-family configuration mode to configure an EIGRP routing instance.
	exit-address-family	Exits address-family configuration mode.
	exit-service-family	Exits service-family configuration mode.
	router eigrp	Configures the EIGRP routing process.
	service-family	Specifies service-family configuration mode.

ip authentication key-chain eigrp

To enable authentication of Enhanced Interior Gateway Routing Protocol (EIGRP) packets, use the **ip authentication key-chain eigrp**command in interface configuration mode. To disable such authentication, use the **no** form of this command.

ip authentication key-chain eigrp *as-number key-chain* **no ip authentication key-chain eigrp** *as-number key-chain*

as-number	<i>number</i> Autonomous system number to which the authentication applies.		
key-chain	Name of the authentication key chain.		
No authentication is provided for EIGRP packets.			
Interface cor	Interface configuration (config-if) Virtual network interface (config-if-vnet)		
ry Release Modification			
Cisco IOS 2	XE Fuji 16.9.2	This command was introduced.	
	key-chain No authentic Interface con Release	key-chain Name of the authentication key No authentication is provided for EIGRP pace Interface configuration (config-if) Virtual net	key-chain Name of the authentication key chain. No authentication is provided for EIGRP packets. Interface configuration (config-if) Virtual network interface (config-if-vnet) Release Modification

Examples The following example applies authentication to autonomous system 2 and identifies a key chain named SPORTS:

Device(config-if) #ip authentication key-chain eigrp 2 SPORTS

Related Commands	Command	Description
	accept-lifetime	Sets the time period during which the authentication key on a key chain is received as valid.
	ip authentication mode eigrp	Specifies the type of authentication used in EIGRP packets.
	key	Identifies an authentication key on a key chain.
	key chain	Enables authentication of routing protocols.
	key-string (authentication)	Specifies the authentication string for a key.
	send-lifetime	Sets the time period during which an authentication key on a key chain is valid to be sent.

ip authentication mode eigrp

To specify the type of authentication used in Enhanced Interior Gateway Routing Protocol (EIGRP) packets, use the **ip authentication mode eigrp**command in interface configuration mode. To disable that type of authentication, use the **no** form of this command.

ip authentication mode eigrp *as-number* md5 no ip authentication mode eigrp *as-number* md5

	-	<u> </u>				
Syntax Description	as-number Autonomous system number.					
	md5	Keyed Message Digest 5 (MD5) authentication.				
Command Default	No authentic	cation is provided for EIG	GRP packets.			
Command Modes	Interface cor	nfiguration (config-if) Vir	rtual network into	erface (config-if-vnet)		
Command History	Release			Modification		
	Cisco IOS X	XE Fuji 16.9.2		This command was introduced.		
Usage Guidelines	Configure authentication to prevent unapproved sources from introducing unauthorized or false routing messages. When authentication is configured, an MD5 keyed digest is added to each EIGRP packet in the specified autonomous system.					
Examples	The following example configures the interface to use MD5 authentication in EIGRP packets in autonomous system 10: Device (config-if) #ip authentication mode eigrp 10 md5					
Related Commands	Command Description					
accept-lifetime Sets the time period during which the authentication chain is received as valid.		priod during which the authentication key on a key d as valid.				
	ip authentication key-chain eigrpEnables authentication of EIGRP packets.keyIdentifies an authentication key on a key chain.					
	key chain		Enables authen	ication of routing protocols.		
	key-string	(authentication)	Specifies the au	thentication string for a key.		
	send-lifetin					

ip bandwidth-percent eigrp

To configure the percentage of bandwidth that may be used by Enhanced Interior Gateway Routing Protocol (EIGRP) on an interface, use the **ip bandwidth-percent eigrp**command in interface configuration mode. To restore the default value, use the **no** form of this command.

ip bandwidth-percent eigrp *as-number percent* **no ip bandwidth-percent eigrp** *as-number percent*

Syntax Description	as-number	Autonomou	us system number.				
	percent	Percent of b	pandwidth that EIGRP may u	ise.			
Command Default	EIGRP may	use 50 perce	ent of available bandwidth.				
Command Modes	Interface configuration (config-if) Virtual network interface (config-if-vnet)						
Command History	Release			Modification			
	Cisco IOS X	KE Fuji 16.9.	2	This comm	hand was introduced.		
Usage Guidelines	EIGRP will use up to 50 percent of the bandwidth of a link, as defined by the bandwidth interface configuration command. This command may be used if some other fraction of the bandwidth is desired. Note that values greater than 100 percent may be configured. The configuration option may be useful if the bandwidth is set artificially low for other reasons.						
Examples	The following example allows EIGRP to use up to 75 percent (42 kbps) of a 56-kbps serial link in autonomous system 209:						
	Device(config) #interface serial 0 Device(config-if) #bandwidth 56 Device(config-if)# ip bandwidth-percent eigrp 209 75						
Related Commands	Command		Description				
	bandwidth	(interface)	Sets a bandwidth value for	an interface.			

ip cef load-sharing algorithm

To select a Cisco Express Forwarding load-balancing algorithm, use the**ip cef load-sharing algorithm** command in global configuration mode. To return to the default universal load-balancing algorithm, use the **no** form of this command.

ip cef load-sharing algorithm {original | [universal [*id*]]} no ip cef load-sharing algorithm

Syntax Description	original	Sets the load-balancing algorithm to the original algorithm based on a source and destination hash.					
	universal	Sets the load-balancing algorithm to the universal algorithm that uses a source and destination and an ID hash.					
	id	(Optional) Fixed identifier.					
Command Default	The universal load-balancing algorithm is selected by default. If you do not configure the fixed identifier for a load-balancing algorithm, the router automatically generates a unique ID.						
Command Modes	Global configuration (config)						
Command History	Release		Modification				
	Cisco IOS XE Fuji 16.9.2		This command was intr	roduced.			
Usage Guidelines	The original Cisco Express Forwarding load-balancing algorithm produced distortions in load sharing across multiple devices because of the use of the same algorithm on every device. When the load-balancing algorithm is set to universal mode, each device on the network can make a different load sharing decision for each source-destination address pair, and that resolves load-balancing distortions.						
Examples	The following example shows how to enable the Cisco Express Forwarding original load-balancing algorithm:						
	Device> enable Device# configure terminal Device(config)# ip cef load-sharing algorithm original Device(config)# exit						
Related Commands	Command	Desc	cription				
	ip load-sha	ring Enables load balancing for Cisco Express Forwarding.					

ip prefix-list

To create a prefix list or to add a prefix-list entry, use the **ip prefix-list** command in global configuration mode. To delete a prefix-list entry, use the **no** form of this command.

ip prefix-list {*list-name* [**seq** *number*] {**deny** | **permit**} *network/length* [**ge** *ge-length*] [**le** *le-length*] | **description** *description* | **sequence-number**}

no ip prefix-list {*list-name* [**seq** *number*] [{**deny** | **permit**} *network/length* [**ge** *ge-length*] [**le** *le-length*]] | **description** *description* | **sequence-number**}

Syntax Description	list-name	Configures a name to identify the prefix list. Do not use the word "detail" or "summary" as a list name because they are keywords in the show ip prefix-list command.			
	seq	(Optional) Applies a sequence number to a prefix-list entry.			
	number	(Optional) Integer from 1 to 4294967294. If a sequence number is not entered when configuring this command, default sequence numbering is applied to the prefix list. The number 5 is applied to the first prefix entry, and subsequent unnumbered entries are incremented by 5.			
	deny	Denies access for a matching condition.			
	permit	Permits access for a matching condition.			
	network / length	Configures the network address and the length of the network mask in bits. The network number can be any valid IP address or prefix. The bit mask can be a number from 1 to 32.			
	ge	(Optional) Specifies the lesser value of a range (the "from" portion of the range description) by applying the <i>ge-length</i> argument to the range specified.			
		Note The ge keyword represents the greater than or equal to operator.			
	ge-length	(Optional) Represents the minimum prefix length to be matched.			
	le	(Optional) Specifies the greater value of a range (the "to" portion of the range description) by applying the <i>le-length</i> argument to the range specified.			
		Note The le keyword represents the less than or equal to operator.			
	le-length	(Optional) Represents the maximum prefix length to be matched.			
	description	(Optional) Configures a descriptive name for the prefix list.			
	description	(Optional) Descriptive name of the prefix list, from 1 to 80 characters in length.			
	sequence-number	(Optional) Enables or disables the use of sequence numbers for prefix lists.			

Command Default

No prefix lists or prefix-list entries are created.

Command Modes Global configuration (config)

I

Command History	Table 3:						
	Release	Modification					
	Cisco IOS XE Fuji 16.9.2	This command was introduced.					
Usage Guidelines	Use the ip prefix-list command to configure IP prefix filtering. Prefix lists are configured with permit or deny keywords to either permit or deny a prefix based on a matching condition. An implicit deny is applied to traffic that does not match any prefix-list entry.						
	A prefix-list entry consists of an IP address subnet, or a single host route. The bit mas	s and a bit mask. The IP address can be for a classful network, a c is a number from 1 to 32.					
	Prefix lists are configured to filter traffic based on a match of an exact prefix length or a match within a range when the ge and le keywords are used. The ge and le keywords are used to specify a range of prefix lengths and provide more flexible configuration than using only the <i>network/length</i> argument. A prefix list is processed using an exact match when neither the ge nor le keyword is specified. If only the ge value is specified, the range is the value entered for the ge <i>ge-length</i> argument to a full 32-bit length. If only the le value is specified, the range is from the value entered for the <i>network/length</i> argument to the le <i>le-length</i> argument. If both the ge <i>ge-length</i> and le <i>le-length</i> keywords and arguments are entered, the range is between the values used for the <i>ge-length</i> arguments.						
	The following formula shows this behavior:						
	<i>length</i> < ge <i>ge-length</i> < le <i>le-length</i> <= 32						
	If the seq keyword is configured without a sequence number, the default sequence number is 5. In this scenario, the first prefix-list entry is assigned the number 5 and subsequent prefix list entries increment by 5. For example, the next two entries would have sequence numbers 10 and 15. If a sequence number is entered for the first prefix list entry but not for subsequent entries, the subsequent entry numbers increment by 5. For example, if the first configured sequence number is 3, subsequent entries will be 8, 13, and 18. Default sequence numbers can be suppressed by entering the no ip prefix-list command with the seq keyword.						
	Evaluation of a prefix list starts with the lowest sequence number and continues down the list until a match is found. When an IP address match is found, the permit or deny statement is applied to that network and the remainder of the list is not evaluated.						
	$\mathbf{\rho}$						
		ently processed prefix list statements should be configured with the <i>umber</i> keyword and argument can be used for resequencing.					
	A prefix list is applied to inbound or outbound updates for a specific peer by entering the neighbor prefix-list command. Prefix list information and counters are displayed in the output of the show ip prefix-list command. Prefix-list counters can be reset by entering the clear ip prefix-list command.						
Examples	In the following example, a prefix list is configured to deny the default route 0.0.0/0:						
	Device(config)#ip prefix-list RED deny 0.0.0.0/0						
	In the following example, a prefix list is configured to permit traffic from the 172.16.1.0/24 subnet:						
	Device(config)#ip prefix-list BLUE permit 172.16.1.0/24						

In the following example, a prefix list is configured to permit routes from the 10.0.0.0/8 network that have a mask length that is less than or equal to 24 bits:

Device(config) #ip prefix-list YELLOW permit 10.0.0.0/8 le 24

In the following example, a prefix list is configured to deny routes from the 10.0.0.0/8 network that have a mask length that is greater than or equal to 25 bits:

Device(config) #ip prefix-list PINK deny 10.0.0.0/8 ge 25

In the following example, a prefix list is configured to permit routes from any network that have a mask length from 8 to 24 bits:

Device(config) #ip prefix-list GREEN permit 0.0.0.0/0 ge 8 le 24

In the following example, a prefix list is configured to deny any route with any mask length from the 10.0.0/8 network:

Device (config) #ip prefix-list ORANGE deny 10.0.0/8	3 le 32
--	---------

Related Commands	Command	Description
	clear ip prefix-list	Resets the prefix list entry counters.
	ip prefix-list description	Adds a text description of a prefix list.
	ip prefix-list sequence	Enables or disables default prefix-list sequencing.
	match ip address	Distributes any routes that have a destination network number address that is permitted by a standard or extended access list, and performs policy routing on packets.
	neighbor prefix-list	Filters routes from the specified neighbor using a prefix list.
	show ip prefix-list	Displays information about a prefix list or prefix list entries.

ip hello-interval eigrp

To configure the hello interval for an Enhanced Interior Gateway Routing Protocol (EIGRP) process, use the **ip hello-interval eigrp** command in interface configuration mode. To restore the default value, use the **no** form of this command.

ip hello-interval eigrp *as-number seconds* **no ip hello-interval eigrp** *as-number* [seconds]

		·				
Syntax Description	as-number	Autonomou	is system number.			
	seconds	Hello interv	val (in seconds). The range is fi	rom 1 to 65535.		
Command Default	The hello interval for low-speed, nonbroadcast multiaccess (NBMA) networks is 60 seconds and 5 seconds for all other networks.					
Command Modes	Interface cor	nfiguration (c	config-if) Virtual network inter-	face (config-if-vi	net)	
Command History	Release Modification					
	Cisco IOS 2	KE Fuji 16.9.	2 Т	This command wa	as introduced.	
Usage Guidelines	T1 or slower of EIGRP, Fi be NBMA. T	; as specified rame Relay a These networ	l with the bandwidth interface nd Switched Multimegabit Dat	configuration co ta Service (SMD e interface has no	w speed is considered to be a rate of ommand. Note that for the purposes S) networks may be considered to be been configured to use physical	
Examples	The following example sets the hello interval for Ethernet interface 0 to 10 seconds:					
	Device(config)#interface ethernet 0 Device(config-if)#ip hello-interval eigrp 109 10					
Related Commands	Command		Description			
	bandwidth	(interface)	Sets a bandwidth value for an	interface.		
	ip hold-tim	e eigrp	Configures the hold time for	a particular EIGI	RP routing process designated by	

the autonomous system number.

ip hold-time eigrp

To configure the hold time for an Enhanced Interior Gateway Routing Protocol (EIGRP) process, use the **ip hold-time eigrp** command in interface configuration mode. To restore the default value, use the **no** form of this command.

ip hold-time eigrp *as-number seconds* **no ip hold-time eigrp** *as-number seconds*

Syntax Description	as-number	Autonomou	us system number.		
	seconds	Hold time ((in seconds). The range is fro	om 1 to 65535.	
Command Default	The EIGRP			onbroadcast m	ultiaccess (NBMA) networks and 15
Command Modes	Interface cor	figuration (c	config-if) Virtual network int	erface (config-	if-vnet)
Command History	Release			Modification	
	Cisco IOS X	KE Fuji 16.9.	2	This comman	d was introduced.
Usage Guidelines	On very congested and large networks, the default hold time might not be sufficient time for all routers and access servers to receive hello packets from their neighbors. In this case, you may want to increase the hold time.				
	We recommend that the hold time be at least three times the hello interval. If a router does not receive a hello packet within the specified hold time, routes through this router are considered unavailable.				
	Increasing th	e hold time o	delays route convergence acr	oss the networ	k.
					apply only to low-speed, NBMA media. h the bandwidth interface configuration
Examples	The followin	ig example so	ets the hold time for Etherne	t interface 0 to	40 seconds:
		2.	ace ethernet 0 hold-time eigrp 109 40

	bandwidth	(interface)	Sets a bandwidth value for	an interface.	
	ip hello-int	erval eigrp	Configures the hello interva autonomous system numbe		RP routing process designated by an

ip load-sharing

To enable load balancing for Cisco Express Forwarding on an interface, use the **ip load-sharing** command in interface configuration mode. To disable load balancing for Cisco Express Forwarding on the interface, use the **no** form of this command.

ip load-sharing { per-destination }
no ip load-sharing

Syntax Description	per-destination Enables per-destination load balancing for Cisco Express Forwarding on the interface.				
Command Default	Per-destination loa	Per-destination load balancing is enabled by default when you enable Cisco Express Forwarding.			
Command Modes	Interface configura	Interface configuration (config-if)			
Command History	Release		Modification]	
	Cisco IOS XE Fuj	i 16.9.2	This command was introduced.		
Usage Guidelines	Per-destination load balancing allows the device to use multiple, equal-cost paths to achieve load sharing. Packets for a given source-destination host pair are guaranteed to take the same path, even if multiple, equal-cost paths are available. Traffic for different source-destination host pairs tends to take different paths.				
Examples	The following example shows how to enable per-destination load balancing:				
		interf	ninal Sace gigabitethernet 1/0/1 load-sharing per-destinati	on	

ip network-broadcast

To receive and accept the network-prefix-directed broadcast packets, configure the **ip network-broadcast** command at the interface of the device.

ip network-broadcast

Syntax Description This command has no arguments or keywords.

Command Default This command is disabled by default.

Command Modes Interface configuration (config-if)

Command History	Release	Modification	
	Cisco IOS XE Amsterdam 17.3.1	This command was introduced.	

Usage Guidelines Configure the ip network-broadcast command at the ingress interface before configuring the ip directed-broadcast command at the egress interface. This ensures that the network-prefix-directed broadcast packets are received and accepted.

The **ip network-broadcast** command is disabled by default. If you do not configure this command, the network-prefix-directed broadcast packets are silently discarded.

Example

The following example shows how to enable the network to accept the network-prefix-directed broadcast packets at ingress and then configure the directed broadcast-to-physical broadcast translation on the egress interface.

```
Device# configure terminal
Device(config)#interface gigabitethernet 1/0/2
Device(config-if)#ip network-broadcast
Device(config-if)#exit
Device(config)#interface gigabitethernet 1/0/3
Device(config-if)#ip directed-broadcast
Device(config-if)#exit
```

ip ospf database-filter all out

To filter outgoing link-state advertisements (LSAs) to an Open Shortest Path First (OSPF) interface, use the **ip ospf database-filter all out** command in interface or virtual network interface configuration modes. To restore the forwarding of LSAs to the interface, use the **no** form of this command.

ip ospf database-filter all out [disable] no ip ospf database-filter all out

Syntax Description	disable (Optional) Disables the filtering of outgoing LSAs to an OSPF interface; all outgoing LSAs are flooded to the interface.						
		lote This k	eyword is available or	ily in virtual ne	etwork interfac	e mode.	
Command Default	This comma	and is disable	d by default. All outgo	oing LSAs are	flooded to the	interface.	
Command Modes	Interface co	nfiguration (config-if)				
	Virtual netw	vork interface	e (config-if-vnet)				
Command History	Release			Modifi	cation		
	Cisco IOS	XE Fuji 16.9	.2	This co	ommand was in	ntroduced.	
Usage Guidelines	This command performs the same function that the neighbor database-filter command performs on a neighbor basis.						
	If the ip ospf database-filter all out command is enabled for a virtual network and you want to disable it, use the disable keyword in virtual network interface configuration mode.						
Examples	The following example prevents filtering of OSPF LSAs to broadcast, nonbroadcast, or point-to-point networks reachable through Ethernet interface 0:						
			Face ethernet 0 ospf database-filt	er all out			
Related Commands	Command		Description				

Related Commands	Command	Description
	neighbor database-filter	Filters outgoing LSAs to an OSPF neighbor.

ip ospf name-lookup

To configure Open Shortest Path First (OSPF) to look up Domain Name System (DNS) names for use in all OSPF **show** EXEC command displays, use the **ip ospf name-lookup** command in global configuration mode. To disable this function, use the **no** form of this command.

ip ospf name-lookup noipospfname-lookup

Syntax Description	This command has no argur	nents or keywords.
--------------------	---------------------------	--------------------

Command Default This command is disabled by default.

Command Modes Global configuration

Command History	Release	Modification		
	Cisco IOS XE Fuji 16.9.2	This command was introduced.		

Usage Guidelines This command makes it easier to identify a router because the router is displayed by name rather than by its router ID or neighbor ID.

Examples The following example configures OSPF to look up DNS names for use in all OSPF **show** EXEC command displays:

Device(config) #ip ospf name-lookup

ip split-horizon eigrp

To enable Enhanced Interior Gateway Routing Protocol (EIGRP) split horizon, use the **ip split-horizon eigrp** command in interface configuration mode. To disable split horizon, use the **no** form of this command.

ip split-horizon eigrp *as-number* **no ip split-horizon eigrp** *as-number*

Related Commands	Command	Description				
	Device(config	<pre>if)#ip split-horizon eigrp 101</pre>				
Examples	The following is an example of how to enable EIGRP split horizon:					
Usage Guidelines	Use the no ip s	lit-horizon eigrp command to disable EIGRP split horizon	n in your configuration.			
	Cisco IOS XE	Fuji 16.9.2This command was i	introduced.			
Command History	Release	Modification				
	Virtual network	interface (config-if-vnet)				
Command Modes	Interface configuration (config-if)					
Command Default	The behavior of	this command is enabled by default.				
Syntax Description	as-number A	utonomous system number.				

ed Commands	Command	Description
	ip split-horizon (RIP)	Enables the split horizon mechanism.
	neighbor (EIGRP)	Defines a neighboring router with which to exchange routing information.

ip summary-address eigrp

To configure address summarization for the Enhanced Interior Gateway Routing Protocol (EIGRP) on a specified interface, use the **ip summary-address eigrp** command in interface configuration or virtual network interface configuration mode. To disable the configuration, use the **no** form of this command.

ip summary-address eigrp *as-number ip-address mask* [*admin-distance*] [**leak-map** *name*] **no ip summary-address eigrp** *as-number ip-address mask*

Syntax Description	as-number Autonomous system number.			
	ip-address	Summary IP address to apply to a	in interface.	
	mask	Subnet mask.		
	admin-distance	(Optional) Administrative distance. Range: 0 to 255.		
		Note Starting with Cisco IOS XE Release 3.2S, the <i>admin-distance</i> argument was removed. Use the summary-metric command to configure the administrative distance.		
	leak-map name	(Optional) Specifies the route-map reference that is used to configure the route lead through the summary.		
Command Default	• EIGRP autom	An administrative distance of 5 is applied to EIGRP summary routes. EIGRP automatically summarizes to the network level, even for a single host route. No summary addresses are predefined.		
	• The default ac	dministrative distance metric for EI	GRP is 90.	
Command Modes	s Interface configuration (config-if)			
	Virtual network interface configuration (config-if-vnet)			
Command History	Release		Modification	
	Cisco IOS XE Fuj	ji 16.9.2	This command was introduced.	
Usage Guidelines The ip summary-address eigrp command is used to configure interfastion summary routes are given an administrative-distance value of 5. The to advertise a summary without installing it in the routing table.		value of 5. The administrative-distance metric is used		
	By default, EIGRP summarizes subnet routes to the network level. The no auto-summary command can entered to configure the subnet-level summarization.		etwork level. The no auto-summary command can be	
	The summary addr	ress is not advertised to the peer if t	the administrative distance is configured as 255.	
	EIGRP Support for Leaking Routes			

	Configuring the leak-map keyword allows a component route that would otherwise be suppressed by the manual summary to be advertised. Any component subset of the summary can be leaked. A route map and access list must be defined to source the leaked route.
	The following is the default behavior if an incomplete configuration is entered:
	• If the leak-map keyword is configured to reference a nonexistent route map, the configuration of this keyword has no effect. The summary address is advertised but all component routes are suppressed.
	• If the leak-map keyword is configured but the access list does not exist or the route map does not reference the access list, the summary address and all component routes are advertised.
	If you are configuring a virtual-network trunk interface and you configure the ip summary-address eigrp command, the <i>admin-distance</i> value of the command is not inherited by the virtual networks running on the trunk interface because the administrative distance option is not supported in the ip summary-address eigrp command on virtual network subinterfaces.
Examples	The following example shows how to configure an administrative distance of 95 on Ethernet interface 0/0 for the 192.168.0.0/16 summary address:
	Device(config) #router eigrp 1 Device(config-router) #no auto-summary Device(config-router) #exit Device(config) #interface Ethernet 0/0 Device(config-if) #ip summary-address eigrp 1 192.168.0.0 255.255.0.0 95
	The following example shows how to configure the $10.1.1.0/24$ subnet to be leaked through the $10.2.2.0$ summary address:
	Device(config) #router eigrp 1 Device(config-router) #exit Device(config) #access-list 1 permit 10.1.1.0 0.0.0.255 Device(config) #route-map LEAK-10-1-1 permit 10 Device(config-route-map) #match ip address 1 Device(config-route-map) #exit Device(config) #interface Serial 0/0 Device(config-if) #ip summary-address eigrp 1 10.2.2.0 255.0.0.0 leak-map LEAK-10-1-1 Device(config-if) #end
	The following example configures GigabitEthernet interface 0/0/0 as a virtual network trunk interface:

```
Device(config) #interface gigabitethernet 0/0/0
Device(config-if) #vnet global
Device(config-if-vnet) #ip summary-address eigrp 1 10.3.3.0 255.0.0.0 33
```

Related Commands	Command	Description
	• • •	Configures automatic summarization of subnet routes to network-level routes (default behavior).
	summary-metric	Configures fixed metrics for an EIGRP summary aggregate address.

ip route static bfd

To specify static route bidirectional forwarding detection (BFD) neighbors, use the **ip route static bfd** command in global configuration mode. To remove a static route BFD neighbor, use the**no** form of this command

ip route static bfd {interface-type interface-number ip-address | vrf vrf-name} [group group-name]
[passive] [unassociate]
no ip route static bfd {interface-type interface-number ip-address | vrf vrf-name} [group group-name]
[passive] [unassociate]

Syntax Description	interface-type interfac	e-number	Interface type and number.	
	ip-address		IP address of the gateway, in A.B.C.D format.	
	vrf vrf-name		Specifies Virtual Routing and Forwarding (VRF) instance and the destination vrf name.	
	group group-name		(Optional) Assigns a BFD group. The group-name is a character string of up to 32 characters specifying the BFD group name.	
	unassociate		(Optional) Unassociates the static route configured for a BFD.	
Command Default	No static route BFD ne	sighbors are specified.		
Command Modes	Global configuration (c	config)		
Command History	Release	Modification		
	Cisco IOS XE Fuji 16.9.2	This command was introduced.		
Usage Guidelines	1	1 5	D neighbors. All static routes that have the same same BFD session for reachability notification.	
	All static routes that specify the same values for the interface-type, interface-number, and ip-address arguments will automatically use BFD to determine gateway reachability and take advantage of fast failure detection.			
	forwarding (VRF) insta member of the group. A member of the group. A BFD session for the group.	ance with which the interface is associ Adding static BFD in a group without A static route should be tracked by the	onfiguration is added to the VPN routing and ated. The passive keyword specifies the passive the passive keyword makes the BFD an active e active BFD configuration in order to trigger a figurations (active and passive) of a specific the BFD group name.	

The **unassociate** keyword specifies that a BFD neighbor is not associated with static route, and the BFD sessions are requested if an interface has been configured with BFD. This is useful in bringing up a BFDv4 session in the absence of an IPv4 static route. If the unassociate keyword is not provided, then the IPv4 static routes are associated with BFD sessions.

BFD requires that BFD sessions are initiated on both endpoint devices. Therefore, this command must be configured on each endpoint device.

The BFD static session on a switch virtual interface (SVI) is established only after the **bfd interval** *milliseconds* **min_rx** *milliseconds* **multiplier***-value* command is disabled and enabled on that SVI.

To enable the static BFD sessions, perform the following steps:

1. Enable BFD timers on the SVI.

bfd interval milliseconds min_rx milliseconds multiplier multiplier-value

2. Enable BFD for the static IP route

ip route static bfd interface-type interface-number ip-address

3. Disable and enable the BFD timers on the SVI again.

no bfd interval milliseconds min_rx milliseconds multiplier multiplier-value

bfd interval milliseconds min_rx milliseconds multiplier multiplier-value

Examples

The following example shows how to configure BFD for all static routes through a specified neighbor, group, and active member of the group:

```
Device#configuration terminal
Device(config)#ip route static bfd GigabitEthernet 1/0/1 10.1.1.1 group group1
```

The following example shows how to configure BFD for all static routes through a specified neighbor, group, and passive member of the group:

```
Device#configuration terminal
Device(config)#ip route static bfd GigabitEthernet 1/0/1 10.2.2.2 group group1 passive
```

The following example shows how to configure BFD for all static routes in an unassociated mode without the group and passive keywords:

```
Device#configuration terminal
Device(config)#ip route static bfd GigabitEthernet 1/0/1 10.2.2.2 unassociate
```

ipv6 route static bfd

To specify static route Bidirectional Forwarding Detection for IPv6 (BFDv6) neighbors, use the **ipv6 route static bfd** command in global configuration mode. To remove a static route BFDv6 neighbor, use the**no** form of this command

ipv6 route static bfd [**vrf** *vrf-name*] *interface-type interface-number ipv6-address* [**unassociated**] **no ipv6 route static bfd**

Syntax Description	vrf vrf-name		(Optional) Name of the virtual routing and forwarding (VRF) instance by which static routes should be specified.	
	interface-type int	erface-number	Interface type and number.	
	ipv6-address		IPv6 address of the neighbor.	
	unassociated		(Optional) Moves a static BFD neighbor from associated mode to unassociated mode.	
Command Default	No static route BF	Dv6 neighbors are specified.		
Command Modes	Global configuration (config)			
Command History	Release	Modification	-	
	Cisco IOS XE Fuji 16.9.2 This command was introduced.			
Usage Guidelines	Use the ipv6 route static bfd command to specify static route neighbors. All of the static routes that have the same interface and gateway specified in the configuration share the same BFDv6 session for reachability notification. BFDv6 requires that BFDv6 sessions are initiated on both endpoint routers. Therefore, this command must be configured on each endpoint router. An IPv6 static BFDv6 neighbor must be fully specified (with the interface and the neighbor address) and must be directly attached.			
	All static routes that specify the same values for vrf vrf-name, interface-type interface-number, and <i>ipv6-address</i> will automatically use BFDv6 to determine gateway reachability and take advantage of fast failure detection.			
Examples	The following exa	mple creates a neighbor on Ethernet inte	erface 0/0 with an address of 2001::1:	
	Device#configuration terminal Device(config)#ipv6 route static bfd ethernet 0/0 2001::1			
	The following example converts the neighbor to unassociated mode:			
	Device# configuration terminal Device(config)# ipv6 route static bfd ethernet 0/0 2001::1 unassociated			

metric weights (EIGRP)

To tune the Enhanced Interior Gateway Routing Protocol (EIGRP) metric calculations, use the **metric weights** command in router configuration mode or address family configuration mode. To reset the values to their defaults, use the **no** form of this command.

Router Configuration metric weights tos k1 k2 k3 k4 k5 no metric weights

```
Address Family Configuration
metric weights tos [k1 [k2 [k3 [k4 [k5 [k6]]]]]]
no metric weights
```

Syntax Description	tos	Type of service. This value must always be zero.		
	k1 k2 k3 k4 k5 k6	(Optional) Constants that convert an EIGRP metric vector into a scalar quantity. Valid values are 0 to 255. Given below are the default values:		
		• <i>k1</i> : 1		
		• k2: 0		
		• <i>k3:</i> 1		
	• <i>k4</i> : 0			
		• <i>k5:</i> 0		
		• <i>k6:</i> 0		
	Note In address family configuration mode, if the values are not specified, de values are configured. The <i>k</i> 6 argument is supported only in address far configuration mode.			
Command Default	EIGRP metric K va	alues are set to their default values.		
Command Modes	Router configuration	on (config-router)		
	Address family cor	nfiguration (config-router-af)		
Command History	Release	Modification		
	Cisco IOS XE Fuj	i 16.9.2 This command was introduced.		
Usage Guidelines	Use this command to alter the default behavior of EIGRP routing and metric computation and to allow the tuning of the EIGRP metric calculation for a particular type of service (ToS).			
	If k5 equals 0, the o	composite EIGRP metric is computed according to the following formula:		
	metric = $[k1 * bandwidth + (k2 * bandwidth)/(256 - load) + k3 * delay + K6 * extended metrics]$			

I

	If k5 does not equal zero, an additional operation is performed:
	metric = metric * $[k5/(reliability + k4)]$
	Scaled Bandwidth= 10^7 /minimum interface bandwidth (in kilobits per second) * 256
	Delay is in tens of microseconds for classic mode and pico seconds for named mode. In classic mode, a delay of hexadecimal FFFFFFF (decimal 4294967295) indicates that the network is unreachable. In named mode, a delay of hexadecimal FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF
	Reliability is given as a fraction of 255. That is, 255 is 100 percent reliability or a perfectly stable link.
	Load is given as a fraction of 255. A load of 255 indicates a completely saturated link.
Examples	The following example shows how to set the metric weights to slightly different values than the defaults:
Examples	
Examples	defaults: Device (config) #router eigrp 109 Device (config-router) #network 192.168.0.0

```
Device(config)#router eigrp virtual-name
Device(config-router)#address-family ipv4 autonomous-system 4533
Device(config-router-af)#metric weights 0 2 0 2 0 0 1
```

Related Commands	Command	Description
	address-family (EIGRP)	Enters address family configuration mode to configure an EIGRP routing instance.
	bandwidth (interface)	Sets a bandwidth value for an interface.
	delay (interface)	Sets a delay value for an interface.
	ipv6 router eigrp	Configures an IPv6 EIGRP routing process.
	metric holddown	Keeps new EIGRP routing information from being used for a certain period of time.
	metric maximum-hops	Causes IP routing software to advertise routes with a hop count higher than what is specified by the command (EIGRP only) as unreachable routes.
	router eigrp	Configures an EIGRP routing process.

neighbor description

To associate a description with a neighbor, use the **neighbor description** command in router configuration mode or address family configuration mode. To remove the description, use the **no** form of this command.

neighbor {*ip-addresspeer-group-name*} **description** *text* **no neighbor** {*ip-addresspeer-group-name*} **description** [*text*]

Syntax Description	ip-address	IP address of the neighbor.	
	peer-group-name	Name of an EIGRP peer group. This argument is not available in address-family configuration mode.	
	text	Text (up to 80 characters in length) that describes the neighbor.	
Command Default	There is no description of the neighbor.		
Command Modes	Router configuration (config-router) Address	s family configuration (config-router-af)	
Command History	Release	Modification	
	Cisco IOS XE Fuji 16.9.2	This command was introduced.	
Examples	In the following examples, the description of the neighbor is "peer with example.com": Device (config) #router bgp 109 Device (config-router) #network 172.16.0.0 Device (config-router) #neighbor 172.16.2.3 description peer with example.com In the following example, the description of the address family neighbor is "address-family-peer": Device (config) #router eigrp virtual-name Device (config-router) #address-family ipv4 autonomous-system 4453 Device (config-router-af) #network 172.16.2.3 description address-family-peer		
Related Commands	Command	Description	
	address-family (EIGRP)	Enters address family configuration mode to configure an EIGRP routing instance.	
	network (EIGRP)	Specifies the network for an EIGRP routing process.	
	router eigrp	Configures the EIGRP address family process.	

network (EIGRP)

To specify the network for an Enhanced Interior Gateway Routing Protocol (EIGRP) routing process, use the **network** command in router configuration mode or address-family configuration mode. To remove an entry, use the **no** form of this command.

network *ip-address* [wildcard-mask] **no network** *ip-address* [wildcard-mask]

	_	1	
Syntax Description	<i>ip-address</i> IP address of the directly connected network.		ted network.
	wildcard-mask	(Optional) EIGRP wildcard bits. Wildcard mask indicates a subnetwork, bitwise complement of the subnet mask.	
Command Default	No networks are specified.		
Command Modes	Router configuration (config-router) Address-family configuration (config-router-af)		
Command History	Release Modification		Modification
	Cisco IOS XE F	Fuji 16.9.2	This command was introduced.
Usage Guidelines	When the network command is configured for an EIGRP routing process, the router matches one or more local interfaces. The network command matches only local interfaces that are configured with addresses that are within the same subnet as the address that has been configured with the network command. The router then establishes neighbors through the matched interfaces. There is no limit to the number of network statements (network commands) that can be configured on a router.		
Use a wildcard mask as a shortcut to group networks together. A wildcard mask matches e network part of an IP address with a zero. Wildcard masks target a specific host/IP address subnet, or even a range of IP addresses.			
	When entered in address-family configuration mode, this command applies only to named EIGRP IPv4 configurations. Named IPv6 and Service Advertisement Framework (SAF) configurations do not support this command in address-family configuration mode.		
Examples	The following example configures EIGRP autonomous system 1 and establishes neighbors through network 172.16.0.0 and 192.168.0.0:		
	Device(config) #router eigrp 1 Device(config-router)# network 172.16.0.0 Device(config-router)# network 192.168.0.0 Device(config-router)# network 192.168.0.0 0.0.255.255		
	-	ample configures EIGRP address- th network 172.16.0.0 and 192.168	family autonomous system 4453 and establishes 8.0.0:
	Device(config)#router eigrp virtual-name Device(config-router)#address-family ipv4 autonomous-system 4453		autonomous-system 4453

Device(config-router-af)#network 172.16.0.0 Device(config-router-af)#network 192.168.0.0

Related Commands	Command	Description
	address-family (EIGRP)	Enters address-family configuration mode to configure an EIGRP routing instance.
	router eigrp	Configures the EIGRP address-family process.

nsf (EIGRP)

To enable Cisco nonstop forwarding (NSF) operations for the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **nsf** command in router configuration or address family configuration mode. To disable EIGRP NSF and to remove the EIGRP NSF configuration from the running-configuration file, use the **no** form of this command.

	nsf no nsf		
Syntax Description	This command has no arguments or k	eywords.	
Command Default	EIGRP NSF is disabled.		
Command Modes	Router configuration (config-router)		
	Address family configuration (config-	-router-af)	
Command History	Release		Modification
	Cisco IOS XE Fuji 16.9.2		This command was introduced.
Usage Guidelines Examples	 The nsf command is used to enable or disable EIGRP NSF support on an NSF-capable router. NSF is supported only on platforms that support High Availability. The following example shows how to disable NSF: Device#configure terminal Device (config) #router eigrp 101 Device (config-router) #no nsf Device (config-router) #end The following example shows how to enable EIGRP IPv6 NSF: 		
	Device#configure terminal Device(config)#router eigrp vir Device(config-router)#address-fa Device(config-router-af)#nsf Device(config-router-af)#end		onomous-system 10
Related Commands	Command	Description	
	debug eigrp address-family ipv6 notifications	Displays infor notifications.	rmation about EIGRP address family IPv6 event
	debug eigrp nsf	Displays notif	fications and information about NSF events for an

I

Command	Description
show ip protocols	Displays the parameters and the current state of the active routing protocol process.
show ipv6 protocols	Displays the parameters and the current state of the active IPv6 routing protocol process.
timers graceful-restart purge-time	Sets the graceful-restart purge-time timer to determine how long an NSF-aware router that is running EIGRP must hold routes for an inactive peer.
timers nsf converge	Sets the maximum time that the restarting router must wait for the end-of-table notification from an NSF-capable or NSF-aware peer.
timers nsf signal	Sets the maximum time for the initial restart period.

offset-list (EIGRP)

To add an offset to incoming and outgoing metrics to routes learned via Enhanced Interior Gateway Routing Protocol (EIGRP), use the **offset-list** command in router configuration mode or address family topology configuration mode. To remove an offset list, use the **no** form of this command.

offset-list {access-list-numberaccess-list-name} {in | out} offset [interface-type interface-number] no offset-list {access-list-numberaccess-list-name} {in | out} offset [interface-type interface-number]

Syntax Description	access-list-number access-list-name		t number or name to be applied. Access list number 0 ks (networks, prefixes, or routes). If the <i>offset</i> value is n.
	in	Applies the access	list to incoming metrics.
	out	Applies the access	list to outgoing metrics.
	offset		e applied to metrics for networks matching the access 0, no action is taken.
	interface-type	(Optional) Interface	e type to which the offset list is applied.
	interface-number	(Optional) Interface	e number to which the offset list is applied.
Command Default	No offset values are added to incoming or outgoing metrics to routes learned via EIGRP.		netrics to routes learned via EIGRP.
Command Modes	Router configuration (config-router) Address family topology configuration (config-router-af-topology		copology configuration (config-router-af-topology)
Command History	Table 4:		
	Release		Modification
	Cisco IOS XE Fuji 16.9.2		This command was introduced.
Usage Guidelines	The offset value is added to the routing metric. An offset list with an interface type and interface number considered extended and takes precedence over an offset list that is not extended. Therefore, if an entry pathe extended offset list and the normal offset list, the offset of the extended offset list is added to the metric.		set list that is not extended. Therefore, if an entry passes
Examples	In the following example, the router applies an offset of 10 to the delay component of the router only to access list 21:		
	Device(config-router)#offset-list 21 out 10		
	In the following example, th 0:	ne router applies an offset of	of 10 to routes learned from Ethernet interface
	Device(config-router)# o	ffset-list 21 in 10 et	thernet 0
	In the following example, th	ne router applies an offset	of 10 to routes learned from Ethernet interface

0 in an EIGRP named configuration:

Device(config) **#router eigrp virtual-name** Device(config-router) **#address-family ipv4 autonomous-system 1** Device(config-router-af) **#topology base** Device(config-router-af-topology) **#offset-list 21 in 10 ethernet0**

redistribute (IP)

To redistribute routes from one routing domain into another routing domain, use the **redistribute** command in the appropriate configuration mode. To disable all or some part of the redistribution (depending on the protocol), use the **no** form of this command. See the "Usage Guidelines" section for detailed, protocol-specific behaviors.

redistribute protocol [process-id] {level-1 | level-2 | level-2 } [autonomous-system-number] [metric {metric-value | transparent }] [metric-type type-value] [match {internal | external 1 | external 2 }] [tag tag-value] [route-map map-tag] [subnets] [nssa-only] no redistribute protocol [process-id] {level-1 | level-1-2 | level-2 } [autonomous-system-number] [metric {metric-value | transparent }] [metric-type type-value] [match {internal | external 1 | external 2 }] [tag tag-value] [route-map map-tag] [subnets] [nssa-only]

Syntax Description	protocol	Source protocol from which routes are being redistributed. It can be one of the following keywords: application , bgp , connected , eigrp , isis , mobile , ospf , rip , or static [ip].
		The static [ip] keyword is used to redistribute IP static routes. The optional ip keyword is used when redistributing into the Intermediate System-to-Intermediate System (IS-IS) protocol.
		The application keyword is used to redistribute an application from one routing domain to another. You can redistribute more than one application to different routing protocols such as IS-IS, OSPF, Border Gateway Protocol (BGP), Enhanced Interior Gateway Routing Protocol (EIGRP) and Routing Information Protocol (RIP).
		The connected keyword refers to routes that are established automatically by virtue of having enabled IP on an interface. For routing protocols such as Open Shortest Path First (OSPF) and IS-IS, these routes will be redistributed as external to the autonomous system.

process-id	(Optional) For the application keyword, this is the name of an application.
	For the bgp or eigrp keyword, this is an autonomous system number, which is a 16-bit decimal number.
	For the isis keyword, this is an optional <i>tag</i> value that defines a meaningful name for a routing process. Creating a name for a routing process means that you use names when configuring routing. You can configure a router in two routing domains and redistribute routing information between these two domains.
	For the ospf keyword, this is an appropriate OSPF process ID from which routes are to be redistributed. This identifies the routing process. This value takes the form of a nonzero decimal number.
	For the rip keyword, no <i>process-id</i> value is needed.
	For the application keyword, this is the name of an application.
	By default, no process ID is defined.
level-1	Specifies that, for IS-IS, Level 1 routes are redistributed into other IP routing protocols independently.
level-1-2	Specifies that, for IS-IS, both Level 1 and Level 2 routes are redistributed into other IP routing protocols.
level-2	Specifies that, for IS-IS, Level 2 routes are redistributed into other IP routing protocols independently.
autonomous-system-number	(Optional) Autonomous system number for the redistributed route. The range is from 1 to 65535.
	• 4-byte autonomous system numbers are supported in the range from 1.0 to 65535.65535 in asdot notation only.
	For more details about autonomous system number formats, see the router bgp command.
metric metric-value	(Optional) When redistributing from one OSPF process to another OSPF process on the same router, the metric will be carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified. The default value is 0.
metric transparent	(Optional) Causes RIP to use the routing table metric for redistributed routes as the RIP metric.

metric-type type value	(Optional) For OSPF, specifies the external link type associated with the default route advertised into the OSPF routing domain. It can be one of two values:
	• 1—Type 1 external route
	• 2—Type 2 external route
	If a metric-type is not specified, the Cisco IOS software adopts a Type 2 external route.
	For IS-IS, it can be one of two values:
	• internal —IS-IS metric that is < 63.
	• external —IS-IS metric that is > 64 < 128.
	The default is internal .
match {internal external1 external2}	(Optional) Specifies the criteria by which OSPF routes are redistributed into other routing domains. It can be one of the following:
	• internal —Routes that are internal to a specific autonomous system.
	• external 1 —Routes that are external to the autonomous system, but are imported into OSPF as Type 1 external routes.
	• external 2 —Routes that are external to the autonomous system, but are imported into OSPF as Type 2 external routes.
	The default is internal .
tag tag-value	(Optional) Specifies the 32-bit decimal value attached to each external route. This is not used by OSPF itself. It may be used to communicate information between Autonomous System Boundary Routers (ASBRs). If none is specified, the remote autonomous system number is used for routes from BGP and Exterior Gateway Protocol (EGP); for other protocols, zero (0) is used.
route-map	(Optional) Specifies the route map that should be interrogated to filter the importation of routes from this source routing protocol to the current routing protocol. If not specified, all routes are redistributed. If this keyword is specified, but no route map tags are listed, no routes will be imported.
map-tag	(Optional) Identifier of a configured route map.

subnets	(Optional) For redistributing routes into OSPF.	
	Note Irrespective of whether the subnets keyword is configured or not, the subnets functionality is enabled by default. This automatic addition results in the redistribution of classless OSPF routes.	
nssa-only	(Optional) Sets the nssa-only attribute for all routes redistributed into OSPF.	

Command Default Route redistribution is disabled.

Command Modes Router configuration (config-router)

Address family configuration (config-af)

Address family topology configuration (config-router-af-topology)

Command History	Release	Modification
	Cisco IOS XE Fuji 16.9.2	This command was introduced.

Using the no Form of the redistribute Command

Caution Removing options that you have configured for the **redistribute** command requires careful use of the **no** form of the **redistribute** command to ensure that you obtain the result that you are expecting. Changing or disabling any keyword may or may not affect the state of other keywords, depending on the protocol.

It is important to understand that different protocols implement the **no** form of the **redistribute** command differently:

- In BGP, OSPF, and RIP configurations, the **no redistribute** command removes only the specified keywords from the **redistribute** commands in the running configuration. They use the *subtractive keyword* method when redistributing from other protocols. For example, in the case of BGP, if you configure **no redistribute static route-map interior**, *only the route map* is removed from the redistribution, leaving **redistribute static** in place with no filter.
- The **no redistribute isis** command removes the IS-IS redistribution from the running configuration. IS-IS removes the entire command, regardless of whether IS-IS is the redistributed or redistributing protocol.
- EIGRP used the subtractive keyword method prior to EIGRP component version rel5. Starting with EIGRP component version rel5, the **no redistribute** command removes the entire **redistribute** command when redistributing from any other protocol.
- An EIGRP routing process is configured when you issue the **router eigrp** command and then specify a network for the process using the **network** sub-command. Suppose that you have not configured an EIGRP routing process, and that you have configured redistribution of routes from such an EIGRP process into BGP, OSPF, or RIP. If you use the **no redistribute eigrp** command to change or disable a parameter in the **redistribute eigrp** command, the **no redistribute eigrp** command removes the entire **redistribute eigrp** command instead of changing or disabling a specific parameter.

Additional Usage Guidelines for the redistribute Command

A router receiving a link-state protocol with an internal metric will consider the cost of the route from itself to the redistributing router plus the advertised cost to reach the destination. An external metric only considers the advertised metric to reach the destination.

Routes learned from IP routing protocols can be redistributed at Level 1 into an attached area or at Level 2. The **level-1-2** keyword allows both Level 1 and Level 2 routes in a single command.

Redistributed routing information must be filtered by the **distribute-list out** router configuration command. This guideline ensures that only those routes intended by the administrator are passed along to the receiving routing protocol.

Whenever you use the **redistribute** or the **default-information** router configuration commands to redistribute routes into an OSPF routing domain, the router automatically becomes an ASBR. However, an ASBR does not, by default, generate a default route into the OSPF routing domain.

When routes are redistributed into OSPF from protocols other than OSPF or BGP, and no metric has been specified with the **metric-type** keyword and *type-value* argument, OSPF will use 20 as the default metric. When routes are redistributed into OSPF from BGP, OSPF will use 1 as the default metric. When routes are redistributed from one OSPF process to another OSPF process, autonomous system external and not-so-stubby-area (NSSA) routes will use 20 as the default metric. When intra-area and inter-area routes are redistributed between OSPF processes, the internal OSPF metric from the redistribution source process is advertised as the external metric in the redistribution destination process. (This is the only case in which the routing table metric will be preserved when routes are redistributed into OSPF.)

Note The **show ip ospf** [**topology-info**] command will display **subnets** keyword irrespective of whether the **subnets** keyword is configured or not. This is because the subnets functionality is enabled by default for OSPF.

On a router internal to an NSSA area, the **nssa-only** keyword causes the originated type-7 NSSA LSAs to have their propagate (P) bit set to zero, which prevents area border routers from translating these LSAs into type-5 external LSAs. On an area border router that is connected to an NSSA and normal areas, the **nssa-only** keyword causes the routes to be redistributed only into the NSSA areas.

Routes configured with the **connected** keyword affected by this **redistribute** command are the routes not specified by the **network** router configuration command.

You cannot use the **default-metric** command to affect the metric used to advertise connected routes.

Note The **metric** value specified in the **redistribute** command supersedes the **metric** value specified in the **default-metric** command.

The default redistribution of Interior Gateway Protocol (IGP) or Exterior Gateway Protocol (EGP) into BGP is not allowed unless the **default-information originate** router configuration command is specified.

4-Byte Autonomous System Number Support

The Cisco implementation of 4-byte autonomous system numbers uses asplain—65538 for example—as the default regular expression match and output display format for autonomous system numbers, but you can configure 4-byte autonomous system numbers in both the asplain format and the asdot format as described

in RFC 5396. To change the default regular expression match and output display of 4-byte autonomous system numbers to asdot format, use the **bgp asnotation dot** command.

Examples

The following example shows how OSPF routes are redistributed into a BGP domain:

```
Device(config)# router bgp 109
Device(config-router)# redistribute ospf
```

The following example shows how to redistribute EIGRP routes into an OSPF domain:

```
Device(config)# router ospf 110
Device(config-router)# redistribute eigrp
```

The following example shows how to redistribute the specified EIGRP process routes into an OSPF domain. The EIGRP-derived metric will be remapped to 100 and RIP routes to 200.

```
Device(config) # router ospf 109
Device(config-router) # redistribute eigrp 108 metric 100 subnets
Device(config-router) # redistribute rip metric 200 subnets
```

The following example shows how to configure BGP routes to be redistributed into IS-IS. The link-state cost is specified as 5, and the metric type is set to external, indicating that it has lower priority than internal metrics.

```
Device(config)# router isis
Device(config-router)# redistribute bgp 120 metric 5 metric-type external
```

The following example shows how to redistribute an application into an OSPF domain and specify a metric value of 5:

```
Device(config)# router ospf 4
Device(config-router)# redistribute application am metric 5
```

In the following example, network 172.16.0.0 will appear as an external LSA in OSPF 1 with a cost of 100 (the cost is preserved):

```
Device(config)# interface ethernet 0
Device(config-if)# ip address 172.16.0.1 255.0.0.0
Device(config-if)# exit
Device(config)# ip ospf cost 100
Device(config)# interface ethernet 1
Device(config-if)# ip address 10.0.0.1 255.0.0.0
!
Device(config)# router ospf 1
Device(config-router)# network 10.0.0.0 0.255.255.255 area 0
Device(config-router)# redistribute ospf 2 subnet
Device(config)# router ospf 2
Device(config-router)# network 172.16.0.0 0.255.255.255 area 0
```

The following example shows how BGP routes are redistributed into OSPF and assigned the local 4-byte autonomous system number in asplain format.

```
Device(config)# router ospf 2
Device(config-router)# redistribute bgp 65538
```

The following example shows how to remove the **connected metric 1000 subnets** options from the **redistribute connected metric 1000 subnets** command and leave the **redistribute connected** command in the configuration:

Device (config-router) # no redistribute connected metric 1000 subnets

The following example shows how to remove the **metric 1000** options from the **redistribute connected metric 1000 subnets** command and leave the **redistribute connected subnets** command in the configuration:

Device(config-router) # no redistribute connected metric 1000

The following example shows how to remove the **subnets** option from the **redistribute connected metric 1000 subnets** command and leave the **redistribute connected metric 1000** command in the configuration:

Device(config-router) # no redistribute connected subnets

The following example shows how to remove the **redistribute connected** command, and any of the options that were configured for the **redistribute connected** command, from the configuration:

Device (config-router) # no redistribute connected

The following example shows how EIGRP routes are redistributed into an EIGRP process in a named EIGRP configuration:

```
Device(config)# router eigrp virtual-name
Device(config-router)# address-family ipv4 autonomous-system 1
Device(config-router-af)# topology base
Device(config-router-af-topology)# redistribute eigrp 6473 metric 1 1 1 1 1
```

The following example shows how to set and disable the redistributions in EIGRP configuration. Note that, in the case of EIGRP, the **no** form of the commands removes the entire set of **redistribute** commands from the running configuration.

```
Device(config) # router eigrp 1
Device(config-router) # network 0.0.0.0
Device (config-router) # redistribute eigrp 2 route-map x
Device (config-router) # redistribute ospf 1 route-map x
Device (config-router) # redistribute bgp 1 route-map x
Device (config-router) # redistribute isis level-2 route-map x
Device (config-router) # redistribute rip route-map x
Device(config) # router eigrp 1
Device (config-router) # no redistribute eigrp 2 route-map x
Device (config-router) # no redistribute ospf 1 route-map x
Device (config-router) # no redistribute bgp 1 route-map x
Device(config-router) # no redistribute isis level-2 route-map x
Device (config-router) # no redistribute rip route-map x
Device (config-router) # end
Device# show running-config | section router eigrp 1
router eigrp 1
network 0.0.0.0
```

The following example shows how to set and disable the redistributions in OSPF configuration. Note that the **no** form of the commands removes only the specified keywords from the **redistribute** command in the running configuration.

```
Device (config) # router ospf 1
Device(config-router) # network 0.0.0.0
Device(config-router) # redistribute eigrp 2 route-map x
Device(config-router) # redistribute ospf 1 route-map x
Device(config-router)# redistribute bgp 1 route-map x
Device(config-router) # redistribute isis level-2 route-map x
Device(config-router) # redistribute rip route-map x
Device(config) # router ospf 1
Device(config-router) # no redistribute eigrp 2 route-map x
Device(config-router) # no redistribute ospf 1 route-map x
Device(config-router)# no redistribute bgp 1 route-map x
Device(config-router)# no redistribute isis level-2 route-map x
Device(config-router) # no redistribute rip route-map x
Device(config-router)# end
Device# show running-config | section router ospf 1
router ospf 1
redistribute eigrp 2
 redistribute ospf 1
 redistribute bqp 1
 redistribute rip
network 0.0.0.0
```

The following example shows how to remove only the route map filter from the redistribution in BGP; redistribution itself remains in force without a filter:

```
Device (config) # router bgp 65000
Device (config-router) # no redistribute eigrp 2 route-map x
```

The following example shows how to remove the EIGRP redistribution to BGP:

```
Device(config) # router bgp 65000
Device(config-router) # no redistribute eigrp 2
```

Related Commands	Command	Description
	default-information originate (OSPF)	Generates a default route into an OSPF routing domain.
	router bgp	Configures the BGP routing process.
	router eigrp	Configures the EIGRP address-family process.

redistribute (IPv6)

To redistribute IPv6 routes from one routing domain into another routing domain, use the **redistribute** command in IPv6 address family configuration mode. To disable redistribution, use the **no** form of this command.

redistribute *protocol* [*process-id*][**include-connected** {**level-1** | **level-2**}][*as-number*][**metric** *metric-value*] {**metric-type** *type-value*}[**nssa-only**][**tag** *tag-value*][**route-map** *map-tag*]

no redistribute *protocol* [*process-id*][**include-connected** {**level-1** | **level-1**2 | **level-2**}][*as-number*][**metric** *metric-value*] {**metric-type** *type-value*}[**nssa-only**][**tag** *tag-value*][**route-map** *map-tag*]

Syntax Description	protocol	Source protocol from which routes are redistributed. It can be one of the following keywords: bgp , connected , eigrp , isis , lisp , nd , omp , ospf (ospfv3), rip , or static .
	process-id	(Optional) For the bgp or eigrp keyword, the process ID is an autonomous system number, which is a 16-bit decimal number.
		For the isis keyword, the process ID is an optional value that defines a meaningful name for a routing process. You can specify only one Intermediate System-to-Intermediate System (IS-IS) process per router. Creating a name for a routing process means that you use names when configuring routing.
		For the ospf keyword, the process ID is the number that is assigned administratively when the Open Shortest Path First (OSPF) for the IPv6 routing process is enabled.
		For the rip keyword, the process ID is an optional value that defines a meaningful name for an IPv6 Routing Information Protocol (RIP) routing process.
	include-connected	(Optional) Allows the target protocol to redistribute routes that are learned by the source protocol and connected prefixes on those interfaces over which the source protocol is running.
	level-1	Specifies that for IS-IS, Level 1 routes are redistributed into other IPv6 routing protocols independently.
	level-1-2	Specifies that for IS-IS, both Level 1 and Level 2 routes are redistributed into other IPv6 routing protocols.
	level-2	Specifies that for IS-IS, Level 2 routes are redistributed into other IPv6 routing protocols independently.
	as-number	(Optional) Autonomous system number for the redistributed route.
	metric <i>metric-value</i>	(Optional) When redistributing from one OSPF process to another OSPF process on the same router, the metric is carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified.

	metric-type	(Optional) Specifies the external link type that is associated with the default route that is advertised into the routing domain. It can be one of two values:	
	type-value	• 1: Type 1 external route	
		• 2: Type 2 external route	
		If no value is specified for the metric-type keyword, the Cisco IOS software adopts a Type 2 external route.	
	nssa-only	(Optional) Limits redistributed routes to not-so-stubby area (NSSA)	
	tag tag-value	(Optional) Specifies the 32-bit decimal value that is attached to each external route. This is not used by OSPF itself. It might be used to communicate information between Autonomous System Boundary Routers (ASBRs). If none is specified, then the remote autonomous system number is used for routes from the BGP and the Exterior Gateway Protocol (EGP); for other protocols, zero (0) is used.	e
	route-map	(Optional) Specifies the route map that is checked to filter the import of routes from this source routing protocol to the current routing protocol. If the route-map keyword is not specified, all the routes are redistributed. If this keyword is specified, but no route map tags are listed, no routes are imported.	
	map-tag	(Optional) Identifier of a configured route map.	
Command Modes		tion (config-router) onfiguration (config-router-af)	
Command History	Release	Mod	dificatio
	Cisco IOS XE Fu	uji 16.9.2 This	is comm
Usage Guidelines	Changing or disa	bling a keyword does not affect the state of other keywords.	
		figured redistribution of routes, if any that are configured with the include-connected dvertises a prefix on an interface if either IS-IS is running over the interface or the interface passive.	ð
		arned from IPv6 routing protocols are redistributed into IPv6 IS-IS at Level 1 into an attached 2. The level-1-2 keyword allows both Level 1 and Level 2 routes in a single command.	1
	For IPv6 RIP, use routes.	e the redistribute command to advertise static routes as if they were directly connected	

Redistributed IPv6 RIP routing information is always filtered by the **distribute-list prefix-list** command in router configuration mode. Using the **distribute-list prefix-list** command ensures that only those routes that are intended by the administrator are passed along to the receiving routing protocol.

I

	Note The metric value that is specified in the redistribute command for IPv6 RIP supersedes the metric value that is specified using the default-metric command.
	In IPv4, if you redistribute a protocol, by default, you also redistribute the subnet on the interfaces over wh the protocol is running. In IPv6, this is not the default behavior. To redistribute the subnet on the interface over which the protocol is running in IPv6, use the include-connected keyword. In IPv6, this functionali is not supported when the source protocol is BGP.
	When the no redistribute command is configured, the parameter settings are ignored when the client protocol is IS-IS or EIGRP.
	IS-IS redistribution is removed completely when IS-IS Level 1 and Level 2 are removed by you. IS-IS level settings can be configured using the redistribute command only.
	The default redistribute type is restored to OSPFv3 when all route type values are removed by you.
	Specify the nssa-only keyword to clear the propagate bit (P-bit) when external routes are redistributed into an NSSA. Doing so prevents corresponding NSSA external link state advertisements (LSAs) from being translated into other areas.
Examples	The following example shows how to configure IPv6 IS-IS to redistribute IPv6 BGP routes. The metric is specified as 5, and the metric type is set to 1.
	Device> enable Device# configure terminal Device(config)# router isis Device(config-router)# address-family ipv6 Device(config-router-af)# redistribute bgp 64500 metric 5 metric-type 1
	The following example shows how to redistribute IPv6 BGP routes into the IPv6 RIP routing process named cisco:
	Device> enable Device# configure terminal Device(config)# router rip cisco Device(config-router)# redistribute bgp 42
	The following example shows how to redistribute IS-IS for IPv6 routes into the OSPFv3 for IPv6 routing process 1:
	Device> enable Device# configure terminal Device(config)# router ospfv3 1 Device(config-router)# address-family ipv6 Device(config-router-af)# redistribute isis 1 metric 32 metric-type 1 tag 85

redistribute maximum-prefix (OSPF)

To limit the number of prefixes that are redistributed into Open Shortest Path First (OSPF) or to generate a warning when the number of prefixes that are redistributed into OSPF reaches a maximum, use the **redistribute maximum-prefix** command in router configuration mode. To remove the values, use the **no** form of this command.

redistribute maximum-prefix *maximum* [*percentage*][**warning-only**] **no redistribute**

			,
Syntax Description	maximum	Integer from 1 to 4294967295 that specifies the maximum number of IP or IPv6 prefixes that can be redistributed into OSPF.	
		When the warning-only keyword is configured, the maximum value specifies the number of prefixes that can be redistributed into OSPF before the system logs a warning message. Redistribution is not limited.	
		The maximum number of IP or IPv6 prefixes that are allowed to be redistributed into OSPF, or the number of prefixes that are allowed to be redistributed into OSPF before the system logs a warning message, depends on whether the warning-only keyword is present.	
		There is no default value for the maximum argument.	
		If the warning-only keyword is also configured, this value does not limit redistribution; i is simply the number of redistributed prefixes that, when reached, causes a warning message to be logged.	
	percentage	(Optional) Integer from 1 to 100 that specifies the threshold value, as a percentage, at which a warning message is generated.	
		The default percentage is 75.	
	warning-only	(Optional) Causes a warning message to be logged when the number of prefixes that are defined by the <i>maximum</i> argument has been exceeded. Additional redistribution is not prevented.	
Command Default	The default percentage is 75.		
Command Modes	Router configuration (config-router) Address family configuration (config-router-af)		
Command History	Release		Modif
	Cisco IOS XE Fuji 16.9.2		This c
Usage Guidelines	A network can be severely flooded if many IP or IPv6 prefixes are injected into the OSPF, perhaps by redistributing Border Gateway Protocol (BGP) into OSPF. Limiting the number of redistributed prefixes prevents this potential problem.		
	When the redistribute maximum-prefix command is configured and the number of redistributed prefixes reaches the maximum value that is configured, no more prefixes are redistributed (unless the warning-only keyword is configured).		

Examples

The following example shows how two warning messages are logged; the first if the number of prefixes redistributed reaches 85 percent of 600 (510 prefixes), and the second if the number of redistributed routes reaches 600. However, the number of redistributed routes is not limited.

```
Device> enable
Device# configure terminal
Device(config)# router ospfv3 11
Device(config-router)# address-family ipv6
Device(config-router-af)# redistribute eigrp 10 subnets
Device(config-router-af)# redistribute maximum-prefix 600 85 warning-only
```

The following example shows how to set a maximum of 10 prefixes that can be redistributed into an OSPFv3 process:

```
Device> enable
Device# configure terminal
Device(config)# router ospfv3 10
Device(config-router)# address-family ipv6 unicast
Device(config-router-af)# redistribute maximum-prefix 10
Device(config-router-af)# redistribute connected
```

route-map

To define conditions for redistributing routes from one routing protocol to another routing protocol, or to enable policy routing, use the **route-map** command in global configuration mode. To delete an entry, use the **no** form of this command.

route-map map-tag [**permit** | **deny**] [sequence-number] **ordering-seq** sequence-name **no route-map** map-tag [**permit** | **deny**] [sequence-number] **ordering-seq** sequence-name

Syntax Description	map-tag	Name for the route map.			
	permit	permit (Optional) Permits only the routes matching the route map to be forwarded or redistributed.			
	deny	(Optional) Blocks routes matching the route map from being forwarded or redistributed.			
	sequence-number	(Optional) Number that indicates the position a new route map will have in the list of route maps already configured with the same name.			
	ordering-seq sequence-name	(Optional) Orders the route maps based on the string provided.			
Command Default	Policy routing is not enabled, a routing protocol are not config	nd conditions for redistributing routes from one routing protocol to another ured.			
Command Modes	Global configuration (config)				
Command History	Release Moo	dification			
	Cisco IOS XE Fuji 16.9.2 This	s command was introduced.			
Usage Guidelines	Use the route-map command t	to enter route-map configuration mode.			
	Use route maps to redistribute rehere.	outes, or to subject packets to policy routing. Both these purposes are described			
	Redistribution				
	to define the conditions for red command has a list of match as <i>criteria</i> , that is, the conditions The set commands specify the enforced by the match comman	iguration command and the match and set route-map configuration commands istributing routes from one routing protocol to another. Each route-map nd set commands associated with it. The match commands specify the <i>match</i> under which redistribution is allowed for the current route-map command. <i>set actions</i> , that is, the redistribution actions to be performed if the criteria ids are met. If the route-map command is enabled and the user does not specify ion is applied by default. The no route-map command deletes the route map.			
	order, and all the match comm	ation command has multiple formats. The match commands can be run in any ands must match to cause the route to be redistributed according to the <i>set</i> ommands. The no forms of the match commands remove the specified match			

Use route maps when you want detailed control over how routes are redistributed between routing processes. The destination routing protocol is the one you specify with the **router** global configuration command. The source routing protocol is the one you specify with the **redistribute** router configuration command. See the examples section for an illustration of how route maps are configured.

When passing routes through a route map, the route map can have several parts. Any route that does not match at least one **match** clause relating to a **route-map** command is ignored, that is, the route is not advertised for outbound route maps, and is not accepted for inbound route maps. If you want to modify only some data, configure a second route map section with an explicit match specified.

The **redistribute** router configuration command uses the name specified by the *map-tag* argument to reference a route map. Multiple route maps can share the same map tag name.

If the match criteria are met for this route map, and the **permit** keyword is specified, the route is redistributed as controlled by the set actions. In the case of policy routing, the packet is policy routed. If the match criteria are not met, and the **permit** keyword is specified, the next route map with the same map tag is tested. If a route passes none of the match criteria for the set of route maps sharing the same name, it is not redistributed by that set.

If the match criteria are met for the route map, and the **deny** keyword is specified, the route is not redistributed. In the case of policy routing, the packet is not policy routed, and no other route maps sharing the same map tag name are examined. If the packet is not policy routed, the normal forwarding algorithm is used.

Policy Routing

Another purpose of route maps is to enable policy routing. Use the **ip policy route-map** or **ipv6 policy route-map** command in addition to the **route-map** command, and the **match** and **set** commands to define the conditions for policy-routing packets. The **match** commands specify the conditions under which policy routing occurs. The **set** commands specify the routing actions to be performed if the criteria enforced by the **match** commands are met. We recommend that you policy route packets some way other than the obvious shortest path.

The sequence-number argument works as follows:

- If no entry is defined with the supplied tag, an entry is created with the *sequence-number* argument set to 10.
- If only one entry is defined with the supplied tag, that entry becomes the default entry for the **route-map** command. The *sequence-number* argument of this entry is unchanged.
- If more than one entry is defined with the supplied tag, an error message is displayed to indicate that the *sequence-number* argument is required.

If the **no route-map** *map-tag* command is specified (without the *sequence-number* argument), the entire route map is deleted.

The following example shows how to redistribute Routing Information Protocol (RIP) routes with a hop count equal to 1 to the Open Shortest Path First (OSPF). These routes will be redistributed to the OSPF as external link-state advertisements (LSAs) with a metric of 5, metric type of type1, and a tag equal to 1.

```
Device> enable
Device# configure terminal
Device(config)# router ospf 109
Device(config-router)# redistribute rip route-map rip-to-ospf
Device(config-router)# exit
Device(config)# route-map rip-to-ospf permit
```

Examples

```
Device(config-route-map)# match metric 1
Device(config-route-map)# set metric 5
Device(config-route-map)# set metric-type type1
Device(config-route-map)# set tag 1
```

The following example for IPv6 shows how to redistribute RIP routes with a hop count equal to 1 to the OSPF. These routes will be redistributed to the OSPF as external LSAs, with a tag equal to 42, and a metric type equal to type1.

```
Device> enable
Device# configure terminal
Device(config)# ipv6 router ospf 1
Device(config-router)# redistribute rip one route-map rip-to-ospfv3
Device(config-router)# exit
Device(config)# route-map rip-to-ospfv3
Device(config-route-map)# match tag 42
Device(config-route-map)# set metric-type type1
```

The following named configuration example shows how to redistribute Enhanced Interior Gateway Routing Protocol (EIGRP) addresses with a hop count equal to 1. These addresses are redistributed to the EIGRP as external, with a metric of 5, and a tag equal to 1:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp virtual-name1
Device(config-router)# address-family ipv4 autonomous-system 4453
Device (config-router-af) # topology base
Device (config-router-af-topology) # redistribute eigrp 6473 route-map
virtual-name1-to-virtual-name2
Device(config-router-af-topology) # exit-address-topology
Device(config-router-af)# exit-address-family
Device(config-router) # router eigrp virtual-name2
Device(config-router)# address-family ipv4 autonomous-system 6473
Device(config-router-af)# topology base
Device(config-router-af-topology) # exit-af-topology
Device(config-router-af)# exit-address-family
Device(config)# route-map virtual-name1-to-virtual-name2
Device (config-route-map) # match tag 42
Device (config-route-map) # set metric 5
Device(config-route-map) # set tag 1
```

Related Commands	Command	Description
	ip policy route-map	Identifies a route map to use for policy routing on an interface.
	ipv6 policy route-map	Configures IPv6 PBR on an interface.
	match	Matches values from the routing table.
	router eigrp	Configures the EIGRP address-family process.
	set	Sets values in the destination routing protocol
	show route-map	Displays all route maps configured or only the one specified.

router-id

To use a fixed router ID, use the **router-id** command in router configuration mode. To force Open Shortest Path First (OSPF) to use the previous OSPF router ID behavior, use the **no** form of this command.

router-id *ip-address* **no router-id** *ip-address*

Syntax Description	<i>ip-address</i> R	Router ID in IP address format.		
Command Default	No OSPF routing process is defined.			
Command Modes	Router configu	iration		
Command History	Release		Modification	
	Cisco IOS XE	C Fuji 16.9.2	This command was int	roduced.
Usage Guidelines	You can config be unique.	gure an arbitrary value in the IP addr	ess format for each router.	However, each router ID must
		d is used on an OSPF router process ext reload or at a manual OSPF proc ommand.		
Examples	The following example specifies a fixed router-id:			
	router-id 10.	.1.1.1		
Related Commands	Command	Description		
	clear ip ospf	Clears redistribution based on the	OSPF routing process ID.	

Configures the OSPF routing process.

router ospf

router eigrp

To configure the EIGRP routing process, use the **router eigrp** command in global configuration mode. To remove an EIGRP routing process, use the **no** form of this command.

router eigrp {autonomous-system-numbervirtual-instance-name} no router eigrp {autonomous-system-numbervirtual-instance-name}

Syntax Description	<i>autonomous-system-number</i> Autonomous system number that identifies the EIGRP services to the other EIGRP address-family routers. It is also used to tag routing information. Valid range is from 1 to 65535.			
	virtual-instance-nameEIGRP virtual instance name. This name must be unique among all the address-family router processes on a single router, but need not be unique among routers.			
Command Default	- No EIGRP processes are confi	gured.		
Command Modes	Global configuration (config)			
Command History	Release		Modification	
	Cisco IOS XE Fuji 16.9.2		This command was introduced.	
Usage Guidelines	 Configuring the router eigrp command with the <i>autonomous-system-number</i> argument creates an EIGRP configuration referred to as autonomous system (AS) configuration. An EIGRP AS configuration creates an EIGRP routing instance that can be used for tagging routing information. Configuring the router eigrp command with the <i>virtual-instance-name</i> argument creates an EIGRP configuration referred to as EIGRP named configuration. An EIGRP named configuration does not create an 			
	EIGRP routing instance by its define address-family configured		configuration is a base configuration that is required to used for routing.	
Examples	The following example shows how to configure EIGRP process 109:			
	Device> enable Device# configure terminal Device(config)# router eigrp 109			
	The following example configures an EIGRP address-family routing process and assigns it the name <i>virtual-name</i> :			
	Device> enable			

router ospfv3

To enter Open Shortest Path First Version 3 (OSPFv3) through router configuration mode, use the **router ospfv3** command in global configuration mode.

router ospfv3 [process-id]

Syntax Description	<i>process-id</i> (Optional) Internal identification. The number that is used here is the number assigned administratively when enabling the OSPFv3 routing process. The range is 1-65535.				
Command Default	OSPFv3 routing process is disabled by default.				
Command Modes	Global configuration (config)				
Command History	Release	Modification			
	Cisco IOS XE Fuji 16.9.2	This command was introduced.			
	taddress-family configuration mode for IPv6 or IPv4, and then configure the IPv6 or IPv4 address family.				
Usage Guidelines	taddress-family configuration mode for IPv6	or IPv4, and then configure the IPv6 or IPv4 address family.			
	-	or IPv4, and then configure the IPv6 or IPv4 address family.			
	taddress-family configuration mode for IPv6 The following example shows how to enter (Device> enable Device# configure terminal Device (config)# router ospfv3 1	or IPv4, and then configure the IPv6 or IPv4 address family.			

send-lifetime

To set the time period during which an authentication key on a key chain is valid to be sent, use the **send-lifetime** command in key chain key configuration mode. To revert to the default value, use the **no** form of this command.

send-lifetime [local] start-time { infinite end-time | duration seconds }
no send-lifetime

Syntax Description	local	Specifies the time in local timezone.	
	start-time	Beginning time that the key specified by the key command is valid to be sent. The syntax can be either of the following:	
		hh : mm : ss month date year	
		hh:mm:ss date month year	
		• <i>hh</i> : Hours	
		• mm: Minutes	
		• ss: Seconds	
		• <i>month</i> : First three letters of the month	
		• <i>date</i> : Date (1-31)	
		• <i>year</i> : Year (four digits)	
		The default start time and the earliest acceptable date is January 1, 1993.	
	infinite	Key is valid to be sent from the <i>start-time</i> value on.	
	end-time	Key is valid to be sent from the <i>start-time</i> value until the <i>end-time</i> value. The syntax is the same as that for the <i>start-time</i> value. The <i>end-time</i> value must be after the <i>start-time</i> value. The default end time is an infinite time period.	
	duration seconds Length of time (in seconds) that the key is valid to be seconds 2147483646.		
Command Default	Forever (the starting	ver (the starting time is January 1, 1993, and the ending time is infinite)	
Command Modes	Key chain key configuration (config-keychain-key)		
Command History	Release	Modification	
	Cisco IOS XE Fuji 1	6.9.2 This command was introduced.	
	Cisco IOS XE Bengaluru 17.5.1 The new range of the duration keyword is from 1 to 2147483646.		
Usage Guidelines	Specify a <i>start-time</i> value and one of the following values: infinite , <i>end-time</i> , or duration <i>seconds</i> .		

We recommend running Network Time Protocol (NTP) or some other time synchronization method if you intend to set lifetimes on keys.

If the last key expires, authentication will continue and an error message will be generated. To disable authentication, you must manually delete the last valid key.

Examples

The following example configures a key chain named chain1. The key named key1 will be accepted from 1:30 p.m. to 3:30 p.m. and be sent from 2:00 p.m. to 3:00 p.m. The key named key2 will be accepted from 2:30 p.m. to 4:30 p.m. and be sent from 3:00 p.m. to 4:00 p.m. The overlap allows for migration of keys or a discrepancy in the set time of the router. There is a 30-minute leeway on each side to handle time differences.

```
Device(config)# interface GigabitEthernet1/0/1
Device (config-if) # ip rip authentication key-chain chain1
Device(config-if) # ip rip authentication mode md5
Device(config-if)# exit
Device (config) # router rip
Device (config-router) # network 172.19.0.0
Device (config-router) # version 2
Device(config-router)# exit
Device(config) # key chain chain1
Device (config-keychain) # key 1
Device(config-keychain-key) # key-string key1
Device (config-keychain-key) # accept-lifetime 13:30:00 Jan 25 1996 duration 7200
Device (config-keychain-key) # send-lifetime 14:00:00 Jan 25 1996 duration 3600
Device (config-keychain-key) # exit
Device (config-keychain) # key 2
Device (config-keychain) # key-string key2
Device (config-keychain) # accept-lifetime 14:30:00 Jan 25 1996 duration 7200
Device (config-keychain) # send-lifetime 15:00:00 Jan 25 1996 duration 3600
```

The following example configures a key chain named chain1 for EIGRP address-family. The key named key1 will be accepted from 1:30 p.m. to 3:30 p.m. and be sent from 2:00 p.m. to 3:00 p.m. The key named key2 will be accepted from 2:30 p.m. to 4:30 p.m. and be sent from 3:00 p.m. to 4:00 p.m. The overlap allows for migration of keys or a discrepancy in the set time of the router. There is a 30-minute leeway on each side to handle time differences.

```
Device (config) # router eigrp 10
Device (config-router) # address-family ipv4 autonomous-system 4453
Device(config-router-af)# network 10.0.0.0
Device(config-router-af) # af-interface ethernet0/0
Device (config-router-af-interface) # authentication key-chain trees
Device (config-router-af-interface) # authentication mode md5
Device(config-router-af-interface) # exit
Device(config-router-af)# exit
Device (config-router) # exit
Device (config) # key chain chain1
Device(config-keychain) # key 1
Device(config-keychain-key)# key-string key1
Device (config-keychain-key) # accept-lifetime 13:30:00 Jan 25 1996 duration 7200
Device (config-keychain-key) # send-lifetime 14:00:00 Jan 25 1996 duration 3600
Device (config-keychain-key) # exit
Device(config-keychain) # key 2
Device(config-keychain-key)# key-string key2
Device (config-keychain-key) # accept-lifetime 14:30:00 Jan 25 1996 duration 7200
Device (config-keychain-key) # send-lifetime 15:00:00 Jan 25 1996 duration 3600
```

Related Commands

Command	Description	
accept-lifetime	Sets the time period during which the authentication key on a key chain is received as valid.	
key	Identifies an authentication key on a key chain.	
key chain	Defines an authentication key chain needed to enable authentication for routing protocols.	
key-string (authentication)	Specifies the authentication string for a key.	
show key chain	Displays authentication key information.	

show ip bgp ipv6 unicast

To display entries in the Internet Protocol version 6 (IPv6) Border Gateway Protocol (BGP) routing table, use the **show ip bgp ipv6 unicast** command in user EXEC or privileged EXEC mode.

	show ip bg	gp ipv6 unicast [pro	efix / length]
Syntax Description	<i>prefix llength</i> (Optional) IPv6 network number and length of the IPv6 prefix, entered to display a particula network in the IPv6 BGP routing table.		
			hal value that indicates how many of the high-order contiguous bits rise the prefix (the network portion of the address). A slash mark cimal value.
Command Modes	User EXEC (>))	
	Privileged EXE	EC (#)	
Command History	_		
Command History	Release		Modification
	Cisco IOS XE	Fuji 16.9.2	This command was introduced.
Usage Guidelines	The show ip bgp ipv6 unicast command provides output similar to the show ip bgp command, except that it is IPv6 specific.		
Examples	The following i the RPKI state		show bgp ipv6 unicast prefix/length command, showing
	Device# show	bgp ipv6 unicast 2010:	::1/128
	Paths: (1 ava	cable entry for 2010::1 ailable, best #1, table to update-groups: 2 och 1	
		(FE80::A8BB:CCFF:FE00:3	300) from 2002::1 (10.0.0.3)
	-	IGP, metric 0, localpr 9ECBD0 RPKI State not	cef 100, valid, external, best found

Table 5: show ip bgp ipv6 Field Descriptions

Field	Description
BGP routing table entry for	IPv6 prefix and prefix length, internal version number of the table. This number is incremented whenever the table changes.

Field	Description
Paths:	Number of routes available to destination.
Advertised to update-groups:	Update group numbers.
3	Autonomous system number.
2002::1 (FE80::A8BB:CCFF:FE00:300) from 2002::1 (10.0.0.3)	Address of the neighbor from which the path was received, link local address of the neighbor, from address of the neighbor, BGP router ID of the neighbor.
Origin	Indicates the origin of the entry.
metric	If shown, the value of the interautonomous system metric.
localpref	Local preference value as set with the set local-preference route-map configuration command. The default value is 100.
valid	Path is legitimate.
external	Path is an External Border Gateway Protocol (EBGP) path.
best path	Path is flagged as the best path; number indicates which path in memory.
RPKI State	RPKI state of the network prefix shown at the beginning of the output. The state could be valid, invalid, or not found.

The table below describes the significant fields shown in the displays.

Table 6: show ip eigrp interfaces Field Descriptions

Field	Description
Interface	Interface on which EIGRP is configured.
Peers	Number of directly connected EIGRP neighbors.

I

Field	Description	
PeerQ Un/Reliable	Number of unreliable and reliable packets queued for transmission to specific peers on the interface.	
Xmit Queue Un/Reliable	Number of packets remaining in the Unreliable and Reliable transmit queues.	
Mean SRTT	Mean smooth round-trip time (SRTT) interval (in seconds).	
Pacing Time Un/Reliable	Pacing time (in seconds) used to determine when EIGRP packets (unreliable and reliable) should be sent out of the interface .	
Multicast Flow Timer	Maximum number of seconds for which the device will send multicast EIGRP packets.	
Pending Routes	Number of routes in the transmit queue waiting to be sent.	
Packetized sent/expedited	Number of EIGRP routes that have been prepared for sending packets to neighbors on an interface, and the number of times multiple routes were stored in a single packet.	
Hello's sent/expedited	Number of EIGRP hello packets that have been sent on an interface and packets that were expedited.	

Related Commands

ands	Command	Description
	show eigrp address-family interfaces	Displays information about address family interfaces configured for EIGRP.

Version 8.0/2.0, Retrans: 0, Retries: 0, Prefixes: 1

Topology-ids from peer - 0
```

The table below describes the significant fields shown in the display.

Table 8: show ip eigrp neighbors detail Field Descriptions

Field	Description
Н	This column lists the order in which a peering session was established with the specified neighbor. The order is specified with sequential numbering starting with 0.
Address	IP address of the EIGRP peer.
Interface	Interface on which the router is receiving hello packets from the peer.
Hold	Time in seconds for which EIGRP waits to hear from the peer before declaring it down.
Lisp Encap	Indicates that routes from this neighbor are LISP encapsulated.
Uptime	Elapsed time (in hours:minutes: seconds) since the local router first heard from this neighbor.
SRTT	Smooth round-trip time. This is the number of milliseconds required for an EIGRP packet to be sent to this neighbor and for the local router to receive an acknowledgment of that packet.
RTO	Retransmission timeout (in milliseconds). This is the amount of time the software waits before resending a packet from the retransmission queue to a neighbor.
Q Cnt	Number of EIGRP packets (update, query, and reply) that the software is waiting to send.

Field	Description
Seq Num	Sequence number of the last update, query, or reply packet that was received from this neighbor.
Version	The software version that the specified peer is running.
Retrans	Number of times that a packet has been retransmitted.
Retries	Number of times an attempt was made to retransmit a packet.

Related Commands

Command	Description
show eigrp address-family neighbors	Displays neighbors discovered by EIGRP.

show ip eigrp topology

To display Enhanced Interior Gateway Routing Protocol (EIGRP) topology table entries, use the **show ip** eigrp topology command in user EXEC or privileged EXEC mode.

show ip eigrp topology [*network* [*mask*] *prefix* | **active** | **all-links** | **detail-links** | **pending** | **secondary-paths** | **summary** | **zero-successors**]

Syntax Description	network	(Optional) Network address.				
	mask	(Optional) Network mask.				
	prefix	(Optional) Network prefix in the format <i><network< i="">>/<i><length< i="">>, for example, 192.168.0.0/16.</length<></i></network<></i>				
	active	(Optional) Displays all topology entries that are in the active state.				
	all-links	(Optional) Displays all the entries in the EIGRP topology table (including nonfeasible successor sources).				
	detail-links	(Optional) Displays all the topology entries with additional details.				
	pending	(Optional) Displays all the entries in the EIGRP topology table that are either waiting for an update from a neighbor or to reply to a neighbor. hs (Optional) Displays the secondary paths in the topology. (Optional) Displays a summary of the EIGRP topology table.				
	secondary-paths					
	summary					
	zero-successors	ero-successors (Optional) Displays the available routes that have zero successors.				
Command Default	If this command is used without any of the optional keywords, only topology entries with feasible successo are displayed and only feasible paths are shown.					
Command Modes	User EXEC (>)					
	Privileged EXEC (#)				
Command History	Release		Modification			
	Cisco IOS XE Fuj	ii 16.9.2	This command was introduced.			
	Cisco IOS XE 17.	13.1	The output displays a message that provides information about the EIGRP state and the action required. The output does not display any message when the EIGRP is in adjacency			
Usage Guidelines	and states. This con with feasible succe	mmand can be used without any a	sopology entries, feasible and nonfeasible paths, metrics, rguments or keywords to display only topology entries inks keyword displays all the paths, whether feasible or l details about these paths.			

Use this command to display information about EIGRP named and EIGRP autonomous system configurations. This command displays the same information as the **show eigrp address-family topology** command. We recommend that you use the **show eigrp address-family topology** command.

After the restart count limit has been crossed, you will need to enter the **clear ip route** * to restore normal peering and redistribution.

Examples

The following is a sample output from the show ip eigrp topology command:

Device# show ip eigrp topology

```
EIGRP-IPv4 Topology Table for AS(1)/ID(10.0.0.1)
Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply,
        r - Reply status, s - sia status
P 10.0.0.0/8, 1 successors, FD is 409600
        via 192.0.2.1 (409600/128256), Ethernet0/0
P 192.16.1.0/24, 1 successors, FD is 409600
        via 192.0.2.1 (409600/128256), Ethernet0/0
P 10.0.0.0/8, 1 successors, FD is 281600
        via Summary (281600/0), Null0
P 10.0.1.0/24, 1 successors, FD is 281600
        via Connected, Ethernet0/0
```

The following is a sample output from the **show ip eigrp topology** *prefix* command, and displays detailed information about a single prefix. The prefix shown is an EIGRP internal route.

```
Device# show ip eigrp topology 10.0.0/8
```

```
EIGRP-IPv4 VR(vr1) Topology Entry for AS(1)/ID(10.1.1.2) for 10.0.0.0/8
State is Passive, Query origin flag is 1, 1 Successor(s), FD is 82329600, RIB is 643200
Descriptor Blocks:
10.1.1.1 (Ethernet2/0), from 10.1.1.1, Send flag is 0x0
Composite metric is (82329600/163840), route is Internal
Vector metric:
    Minimum bandwidth is 16000 Kbit
    Total delay is 631250000 picoseconds
    Reliability is 255/255
    Load is ½55
    Minimum MTU is 1500
    Hop count is 1
    Originating router is 10.1.1.1
```

The following is a sample output from the **show ip eigrp topology** *prefix* command, and displays detailed information about a single prefix. The prefix shown is an EIGRP external route.

```
Device# show ip eigrp topology 192.16.1.0/24
```

```
EIGRP-IPv4 Topology Entry for AS(1)/ID(10.0.0.1) for 192.16.1.0/24
State is Passive, Query origin flag is 1, 1 Successor(s), FD is 409600, RIB is 643200
Descriptor Blocks:
172.16.1.0/24 (Ethernet0/0), from 10.0.1.2, Send flag is 0x0
Composite metric is (409600/128256), route is External
Vector metric:
Minimum bandwidth is 10000 Kbit
Total delay is 6000 picoseconds
Reliability is 255/255
Load is ½55
Minimum MTU is 1500
```

```
Hop count is 1
Originating router is 192.16.1.0/24
External data:
AS number of route is 0
External protocol is Connected, external metric is 0
Administrator tag is 0 (0x0000000)
```

The following is a sample output from the **show ip eigrp topology** *prefix* command displays Equal Cost Multipath (ECMP) mode information when the **no ip next-hop-self** command is configured without the **no-ecmp-mode** keyword in an EIGRP topology. The ECMP mode provides information about the path that is being advertised. If there is more than one successor, the top-most path is advertised as the default path over all the interfaces, and ECMP Mode: Advertise by default is displayed in the output. If any path other than the default path is advertised, ECMP Mode: Advertise out <Interface name> is displayed.

The topology table displays entries of routes for a particular prefix. The routes are sorted based on metric, next-hop, and infosource. In a Dynamic Multipoint VPN (DMVPN) scenario, routes with the same metric and next hop are sorted based on infosource. The top route in the ECMP is always advertised.

```
Device# show ip eigrp topology 192.168.10.0/24
```

```
EIGRP-IPv4 Topology Entry for AS(1)/ID(10.10.100.100) for 192.168.10.0/24
State is Passive, Query origin flag is 1, 2 Successor(s), FD is 284160
  Descriptor Blocks:
  10.100.1.0 (TunnelO), from 10.100.0.1, Send flag is 0x0
      Composite metric is (284160/281600), route is Internal
      Vector metric:
        Minimum bandwidth is 10000 Kbit
       Total delay is 1100 microseconds
       Reliability is 255/255
        Load is ½55
       Minimum MTU is 1400
        Hop count is 1
        Originating router is 10.10.1.1
        ECMP Mode: Advertise by default
        10.100.0.2 (Tunnel1), from 10.100.0.2, Send flag is 0X0
        Composite metric is (284160/281600), route is Internal
        Vector metric:
        Minimum bandwidth is 10000 Kbit
        Total delay is 1100 microseconds
        Reliability is 255/255
        Load is ½55
        Minimum MTU is 1400
        Hop count is 1
        Originating router is 10.10.2.2
        ECMP Mode: Advertise out Tunnel1
```

The following is a sample output from the **show ip eigrp topology all-links** command, and displays all the paths, including those that are not feasible:

```
Device# show ip eigrp topology all-links
```

```
EIGRP-IPv4 Topology Table for AS(1)/ID(10.0.0.1)
Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply,
    r - reply Status, s - sia Status
P 172.16.1.0/24, 1 successors, FD is 409600, serno 14
    via 10.10.1.2 (409600/128256), Ethernet0/0
    via 10.1.4.3 (2586111744/2585599744), Serial3/0, serno 18
```

The following is a sample output from the **show ip eigrp topology detail-links** command, and displays additional details about routes:

Device# show ip eigrp topology detail-links EIGRP-IPv4 Topology Table for AS(1)/ID(10.0.0.1) Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply, r - reply Status, s - sia Status P 10.0.0.0/8, 1 successors, FD is 409600, serno 6 via 10.10.1.2 (409600/128256), Ethernet0/0 P 172.16.1.0/24, 1 successors, FD is 409600, serno 14 via 10.10.1.2 (409600/128256), Ethernet0/0 P 10.0.0.0/8, 1 successors, FD is 281600, serno 3 via Summary (281600/0), Null0 P 10.1.1.0/24, 1 successors, FD is 281600, serno 1 via Connected, Ethernet0/0

The following is a sample output from the **show ip eigrp topology** command. The EIGRP process is in pending state :

Device# show ip eigrp topology

```
EIGRP-IPv4 Topology Table for AS(1)/ID(10.0.0.1)
Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply,
        r - Reply status, s - sia status
Process is in pending state. Restart in 294 sec.
P 10.0.0.0/8, 1 successors, FD is 409600
        via 192.0.2.1 (409600/128256), Ethernet0/0
P 192.16.1.0/24, 1 successors, FD is 409600
        via 192.0.2.1 (409600/128256), Ethernet0/0
P 10.0.0.0/8, 1 successors, FD is 281600
        via Summary (281600/0), Null0
P 10.0.1.0/24, 1 successors, FD is 281600
        via Connected, Ethernet0/0
```

The following is a sample output from the **show ip eigrp topology** command. The EIGRP process is in down state :

Device# show ip eigrp topology

```
EIGRP-IPv4 Topology Table for AS(1)/ID(10.0.0.1)
Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply,
        r - Reply status, s - sia status
Process is in DOWN state. Manual restart required.
P 10.0.0.0/8, 1 successors, FD is 409600
        via 192.0.2.1 (409600/128256), Ethernet0/0
P 192.16.1.0/24, 1 successors, FD is 409600
        via 192.0.2.1 (409600/128256), Ethernet0/0
P 10.0.0.0/8, 1 successors, FD is 281600
        via Summary (281600/0), Null0
P 10.0.1.0/24, 1 successors, FD is 281600
        via Connected, Ethernet0/0
```

The following is a sample output from the **show ip eigrp topology detail-links** command, and displays additional details about routes. The EIGRP redistribution is in pending state :

Device# show ip eigrp topology detail-links

```
EIGRP-IPv4 Topology Table for AS(1)/ID(10.0.0.1)
Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply,
    r - reply Status, s - sia Status
Redistribution is in pending state. Restart in 294 sec.
P 10.0.0.0/8, 1 successors, FD is 409600, serno 6
    via 10.10.1.2 (409600/128256), Ethernet0/0
P 172.16.1.0/24, 1 successors, FD is 409600, serno 14
```

```
via 10.10.1.2 (409600/128256), Ethernet0/0
P 10.0.0.0/8, 1 successors, FD is 281600, serno 3
via Summary (281600/0), Null0
P 10.1.1.0/24, 1 successors, FD is 281600, serno 1
via Connected, Ethernet0/0
```

The following is a sample output from the **show ip eigrp topology** command. The EIGRP redistribution is in down state :

Device# show ip eigrp topology

```
EIGRP-IPv4 Topology Table for AS(1)/ID(10.0.0.1)
Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply,
    r - Reply status, s - sia status
Redistribution is in DOWN state. Manual restart required.
P 10.0.0.0/8, 1 successors, FD is 409600
    via 192.0.2.1 (409600/128256), Ethernet0/0
P 192.16.1.0/24, 1 successors, FD is 409600
    via 192.0.2.1 (409600/128256), Ethernet0/0
P 10.0.0.0/8, 1 successors, FD is 281600
    via Summary (281600/0), Null0
P 10.0.1.0/24, 1 successors, FD is 281600
    via Connected, Ethernet0/0
```

The following table describes the significant fields shown in the above examples:

Field	Description
Codes	State of this topology table entry. Passive and Active refer to the EIGRP state with respect to the destination. Update, Query, and Reply refer to the type of packet that is being sent.
	• P - Passive: Indicates that no EIGRP computations are being performed for this route.
	• A - Active: Indicates that EIGRP computations are being performed for this route.
	• U - Update: Indicates that a pending update packet is waiting to be sent for this route.
	• Q - Query: Indicates that a pending query packet is waiting to be sent for this route.
	• R - Reply: Indicates that a pending reply packet is waiting to be sent for this route.
	• r - Reply status: Indicates that EIGRP has sent a query for the route and is waiting for a reply from the specified path.
	• s - sia status: Indicates that the EIGRP query packet is in stuck-in-active (SIA) status.

Table 9: show ip eigrp topology Field Descriptions

Field	Description
successors	Number of successors. This number corresponds to the number of next hops in the IP routing table. If successors is capitalized, then the route or the next hop is in a transition state.
serno	Serial number.
FD	Feasible distance. This is the best metric to reach the destination or the best metric that was known when the route became active. This value is used in the feasibility condition check. If the reported distance of the device is less than the feasible distance, the feasibility condition is met and that route becomes a feasible successor. After the software determines that it has a feasible successor, the software need not send a query for that destination.
via	Next-hop address that advertises the passive route.

Related Commands	Command	Description
	show eigrp address-family topology	Displays entries in the EIGRP address-family topology table.

show ip eigrp traffic

To display the number of Enhanced Interior Gateway Routing Protocol (EIGRP) packets sent and received, use the **show ip eigrp traffic** command in privileged EXEC mode.

show ip eigrp [**vrf** {*vrf-name* | *****}] [*autonomous-system-number*] **traffic**

Syntax Description	vrf vrf-name	(Optional) Displays in	nformation about the specified VRF.
	vrf *	(Optional) Displays in	nformation about all VRFs.
	autonomous-system-number	(Optional) Autonomo	us system number.
Command Modes	Privileged EXEC (#)		
Command History	Release		Modification
	Cisco IOS XE Fuji 16.9.2		This command was introduced.
Usage Guidelines	 This command can be used to display information about EIGRP named configurations and EIGRP autonomous-system (AS) configurations. This command displays the same information as the show eigrp address-family traffic command. Cisc recommends using the show eigrp address-family traffic command. 		
Examples	The following is sample output	It from the show ip eig	rp traffic command:
	Device #show ip eigrp traf EIGRP-IPv4 Traffic Statis Hellos sent/received: 214 Updates sent/received: 22 Queries sent/received: 0/ Acks sent/received: 0/ Acks sent/received: 16/13 SIA-Queries sent/received SIA-Replies sent/received Hello Process ID: 204 PDM Process ID: 203 Socket Queue: 0/2000/2/0 (tics for AS(60) 29/2809 /17 0 0 : 0/0 : 0/0 : 0/0 (current/max/highes)	
	The table below describes the significant fields shown in the display.		
	Table 10: show ip eigrp traffic Field D	escriptions	

Field	Description
Hellos sent/received	Number of hello packets sent and received.
Updates sent/received	Number of update packets sent and received.
Queries sent/received	Number of query packets sent and received.

Table 10: show ip eigrp traffic Field Descriptions

Field	Description
Replies sent/received	Number of reply packets sent and received.
Acks sent/received	Number of acknowledgement packets sent and received.
SIA-Queries sent/received	Number of stuck in active query packets sent and received.
SIA-Replies sent/received	Number of stuck in active reply packets sent and received.
Hello Process ID	Hello process identifier.
PDM Process ID	Protocol-dependent module IOS process identifier.
Socket Queue	The IP to EIGRP Hello Process socket queue counters.
Input queue	The EIGRP Hello Process to EIGRP PDM socket queue counters.

Related Commands	Command	Description
	show eigrp address-family traffic	Displays the number of EIGRP packets sent and received.

show ip ospf

To display general information about Open Shortest Path First (OSPF) routing processes, use the **showipospf** command in user EXEC or privileged EXEC mode.

show ip ospf [process-id]

Syntax Description	<i>process-id</i> (Optional) Process ID. If this argument is included, only information for the specified routing process is included.		
Command Modes	User EXEC	Privileged EXEC	
Command History	Mainline R	elease	Modification
	Cisco IOS	XE Fuji 16.9.2	This command was introduced.
Examples	The following is sample output from the showipospf command when entered without a specific OSPF process ID:		pf command when entered without a specific
	Device#show ip ospf

       Number of opaque link LSA 0. Checksum Sum 0x000000
       Number of DCbitless LSA 0
       Number of indication LSA 0
       Number of DoNotAge LSA 0
       Flood list length 0
```

The table below describes the significant fields shown in the display.

Table 11: show ip ospf Field Descriptions

Field	Description
Routing process "ospf 201" with ID 10.0.0.1	Process ID and OSPF router ID.
Supports	Number of types of service supported (Type 0 only).
SPF schedule delay	Delay time (in seconds) of SPF calculations.
Minimum LSA interval	Minimum interval (in seconds) between link-state advertisements.

Field	Description
LSA group pacing timer	Configured LSA group pacing timer (in seconds).
Interface flood pacing timer	Configured LSA flood pacing timer (in milliseconds).
Retransmission pacing timer	Configured LSA retransmission pacing timer (in milliseconds).
Number of external LSA	Number of external link-state advertisements.
Number of opaque AS LSA	Number of opaque link-state advertisements.
Number of DCbitless external and opaque AS LSA	Number of demand circuit external and opaque link-state advertisements.
Number of DoNotAge external and opaque AS LSA	Number of do not age external and opaque link-state advertisements.
Number of areas in this router is	Number of areas configured for the router.
External flood list length	External flood list length.
BFD is enabled	BFD has been enabled on the OSPF process.

The following is an excerpt of output from the **showipospf** command when the OSPF Forwarding Address Suppression in Type-5 LSAs feature is configured:

```
Device#show ip ospf
```

```
Area 2
   Number of interfaces in this area is 4
   It is a NSSA area
   Perform type-7/type-5 LSA translation, suppress forwarding address
Routing Process "ospf 1" with ID 192.168.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs

Number of areas in this router is 0. 0 normal 0 stub 0 nssa
External flood list length 0
```

The table below describes the significant fields shown in the display.

Table 12: show ip ospf Field Descriptions

Field	Description
Area	OSPF area and tag.
Number of interfaces	Number of interfaces configured in the area.
It is	Possible types are internal, area border, or autonomous system boundary.
Routing process "ospf 1" with ID 192.168.0.1	Process ID and OSPF router ID.
Supports	Number of types of service supported (Type 0 only).
Initial SPF schedule delay	Delay time of SPF calculations at startup.
Minimum hold time	Minimum hold time (in milliseconds) between consecutive SPF calculations.
Maximum wait time	Maximum wait time (in milliseconds) between consecutive SPF calculations.
Incremental-SPF	Status of incremental SPF calculations.
Minimum LSA	Minimum time interval (in seconds) between link-state advertisements, and minimum arrival time (in milliseconds) of link-state advertisements,
LSA group pacing timer	Configured LSA group pacing timer (in seconds).
Interface flood pacing timer	Configured LSA flood pacing timer (in milliseconds).
Retransmission pacing timer	Configured LSA retransmission pacing timer (in milliseconds).
Number of	Number and type of link-state advertisements that have been received.
Number of external LSA	Number of external link-state advertisements.
Number of opaque AS LSA	Number of opaque link-state advertisements.
Number of DCbitless external and opaque AS LSA	Number of demand circuit external and opaque link-state advertisements.
Number of DoNotAge external and opaque AS LSA	Number of do not age external and opaque link-state advertisements.
Number of areas in this router is	Number of areas configured for the router listed by type.
External flood list length	External flood list length.

The following is sample output from the **showipospf** command. In this example, the user had configured the **redistributionmaximum-prefix** command to set a limit of 2000 redistributed routes. SPF throttling was configured with the **timersthrottlespf** command.

```
Device#show ip ospf 1
Routing Process "ospf 1" with ID 10.0.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
It is an autonomous system boundary router
Redistributing External Routes from,
   static, includes subnets in redistribution
   Maximum limit of redistributed prefixes 2000
   Threshold for warning message 75%
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
```

The table below describes the significant fields shown in the display.

Field	Description
Routing process "ospf 1" with ID 10.0.0.1	Process ID and OSPF router ID.
Supports	Number of Types of Service supported.
It is	Possible types are internal, area border, or autonomous system boundary router.
Redistributing External Routes from	Lists of redistributed routes, by protocol.
Maximum limit of redistributed prefixes	Value set in the redistributionmaximum-prefix command to set a limit on the number of redistributed routes.
Threshold for warning message	Percentage set in the redistributionmaximum-prefix command for the threshold number of redistributed routes needed to cause a warning message. The default is 75 percent of the maximum limit.
Initial SPF schedule delay	Delay (in milliseconds) before initial SPF schedule for SPF throttling. Configured with the timersthrottlespf command.
Minimum hold time between two consecutive SPFs	Minimum hold time (in milliseconds) between two consecutive SPF calculations for SPF throttling. Configured with the timersthrottlespf command.
Maximum wait time between two consecutive SPFs	Maximum wait time (in milliseconds) between two consecutive SPF calculations for SPF throttling. Configured with the timersthrottlespf command.
Number of areas	Number of areas in router, area addresses, and so on.

The following is sample output from the **showipospf** command. In this example, the user had configured LSA throttling, and those lines of output are displayed in bold.

```
Device#show ip ospf 1
Routing Process "ospf 4" with ID 10.10.24.4
 Supports only single TOS(TOS0) routes
 Supports opaque LSA
 Supports Link-local Signaling (LLS)
 Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
 Incremental-SPF disabled
 Initial LSA throttle delay 100 msecs
Minimum hold time for LSA throttle 10000 msecs
Maximum wait time for LSA throttle 45000 msecs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 0. Checksum Sum 0x0
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
 External flood list length 0
    Area 24
        Number of interfaces in this area is 2
        Area has no authentication
        SPF algorithm last executed 04:28:18.396 ago
        SPF algorithm executed 8 times
        Area ranges are
        Number of LSA 4. Checksum Sum 0x23EB9
        Number of opaque link LSA 0. Checksum Sum 0x0
        Number of DCbitless LSA 0
        Number of indication LSA 0
        Number of DoNotAge LSA 0
        Flood list length 0
```

The following is sample **showipospf**command. In this example, the user had configured the **redistributionmaximum-prefix** command to set a limit of 2000 redistributed routes. SPF throttling was configured with the **timersthrottlespf** command.

```
Device#show ip ospf 1
Routing Process "ospf 1" with ID 192.168.0.0
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
It is an autonomous system boundary router
Redistributing External Routes from,
   static, includes subnets in redistribution
   Maximum limit of redistributed prefixes 2000
   Threshold for warning message 75%
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
```

The table below describes the significant fields shown in the display.

Field	Description
Routing process "ospf 1" with ID 192.168.0.0.	Process ID and OSPF router ID.
Supports	Number of TOS supported.
It is	Possible types are internal, area border, or autonomous system boundary routers.
Redistributing External Routes from	Lists of redistributed routes, by protocol.
Maximum limit of redistributed prefixes	Value set in the redistributionmaximum-prefix command to set a limit on the number of redistributed routes.
Threshold for warning message	Percentage set in the redistributionmaximum-prefix command for the threshold number of redistributed routes needed to cause a warning message. The default is 75 percent of the maximum limit.
Initial SPF schedule delay	Delay (in milliseconds) before the initial SPF schedule for SPF throttling. Configured with the timersthrottlespf command.
Minimum hold time between two consecutive SPFs	Minimum hold time (in milliseconds) between two consecutive SPF calculations for SPF throttling. Configured with the timersthrottlespf command.
Maximum wait time between two consecutive SPFs	Maximum wait time (in milliseconds) between two consecutive SPF calculations for SPF throttling. Configured with the timersthrottlespf command.
Number of areas	Number of areas in router, area addresses, and so on.

Table 14: show ip ospf Field Descriptions

The following is sample output from the **showipospf** command. In this example, the user had configured LSA throttling, and those lines of output are displayed in bold.

Device#show ip ospf 1

```
Routing Process "ospf 4" with ID 10.10.24.4
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
 Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
Incremental-SPF disabled
Initial LSA throttle delay 100 msecs
Minimum hold time for LSA throttle 10000 msecs
Maximum wait time for LSA throttle 45000 msecs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs

show ip ospf border-routers

To display the internal Open Shortest Path First (OSPF) routing table entries to an Area Border Router (ABR) and Autonomous System Boundary Router (ASBR), use the **showipospfborder-routers** command in privileged EXEC mode.

show ip ospf border-routers

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC

Command History	Release	Modification
	Cisco IOS XE Fuji 16.9.2	This command was introduced.

Examples

The following is sample output from the **showipospfborder-routers** command:

```
Device#show ip ospf border-routers

OSPF Process 109 internal Routing Table

Codes: i - Intra-area route, I - Inter-area route

i 192.168.97.53 [10] via 172.16.1.53, SerialO, ABR, Area 0.0.0.3, SPF 3

i 192.168.103.51 [10] via 192.168.96.51, SerialO, ABR, Area 0.0.0.3, SPF 3

I 192.168.103.52 [22] via 192.168.96.51, SerialO, ASBR, Area 0.0.0.3, SPF 3

I 192.168.103.52 [22] via 172.16.1.53, SerialO, ASBR, Area 0.0.0.3, SPF 3
```

The table below describes the significant fields shown in the display.

Table 15: show ip ospf border-routers Field Descriptions

Field	Description
192.168.97.53	Router ID of the destination.
[10]	Cost of using this route.
via 172.16.1.53	Next hop toward the destination.
Serial0	Interface type for the outgoing interface.
ABR	The router type of the destination; it is either an ABR or ASBR or both.
Area	The area ID of the area from which this route is learned.
SPF 3	The internal number of the shortest path first (SPF) calculation that installs this route.

show ip ospf database

To display lists of information related to the Open Shortest Path First (OSPF) database for a specific router, use the **showipospfdatabase** command in EXEC mode.

show ip ospf [process-id area-id] database show ip ospf [process-id area-id] database [adv-router [ip-address]] **show ip ospf** [process-id area-id] **database** [asbr-summary] [link-state-id] show ip ospf [process-id area-id] database [asbr-summary] [link-state-id] [adv-router [ip-address]] show ip ospf [process-id area-id] database [asbr-summary] [link-state-id] [self-originate] [link-state-id] show ip ospf [process-id area-id] database [database-summary] **show ip ospf** [process-id] **database** [external] [link-state-id] show ip ospf [process-id] database [external] [link-state-id] [adv-router [ip-address]] show ip ospf [process-id area-id] database [external] [link-state-id] [self-originate] [link-state-id] show ip ospf [process-id area-id] database [network] [link-state-id] show ip ospf [process-id area-id] database [network] [link-state-id] [adv-router [ip-address]] show ip ospf [process-id area-id] database [network] [link-state-id] [self-originate] [link-state-id] show ip ospf [process-id area-id] database [nssa-external] [link-state-id] show ip ospf [process-id area-id] database [nssa-external] [link-state-id] [adv-router [ip-address]] show ip ospf [process-id area-id] database [nssa-external] [link-state-id] [self-originate] [link-state-id] show ip ospf [process-id area-id] database [router] [link-state-id] show ip ospf [process-id area-id] database [router] [adv-router [ip-address]] show ip ospf [process-id area-id] database [router] [self-originate] [link-state-id] show ip ospf [process-id area-id] database [self-originate] [link-state-id] **show ip ospf** [process-id area-id] **database** [summary] [link-state-id] show ip ospf [process-id area-id] database [summary] [link-state-id] [adv-router [ip-address]] show ip ospf [process-id area-id] database [summary] [link-state-id] [self-originate] [link-state-id] [process-id area-id] database lsa-summary show ip ospf show [process-id area-id] database lsa-summary detail ip ospf show ip **ospf** [process-id area-id] database Isa-summary router-id router-id

Syntax Description	process-id	(Optional) Internal identification. It is locally assigned and can be any positive integer. The number used here is the number assigned administratively when enabling the OSPF routing process.
	area-id	(Optional) Area number associated with the OSPF address range defined in the network router configuration command used to define the particular area.
	adv-router [ip-address	(Optional) Displays all the LSAs of the specified router. If no IP address is included, the information is about the local router itself (in this case, the same as self-originate).

I

link-state-id	(Optional) Portion of the Internet environment that is being described by the advertisement. The value entered depends on the advertisement's LS type. It must be entered in the form of an IP address.	
	When the link state advertisement is describing a network, the <i>link-state-id</i> can take one of two forms:	
	The network's IP address (as in type 3 summary link advertisements and in autonomous system external link advertisements).	
	A derived address obtained from the link state ID. (Note that masking a network links advertisement's link state ID with the network's subnet mask yields the network's IP address.)	
	When the link state advertisement is describing a router, the link state ID is always the described router's OSPF router ID.	
	When an autonomous system external advertisement (LS Type = 5) is describing a default route, its link state ID is set to Default Destination $(0.0.0.0)$.	
asbr-summary	(Optional) Displays information only about the autonomous system boundary router summary LSAs.	
database-summary	(Optional) Displays how many of each type of LSA for each area there are in the database, and the total.	
external	(Optional) Displays information only about the external LSAs.	
network	·k (Optional) Displays information only about the network LSAs.	
nssa-external	(Optional) Displays information only about the NSSA external LSAs.	
router	(Optional) Displays information only about the router LSAs.	
self-originate	(Optional) Displays only self-originated LSAs (from the local router).	
summary	(Optional) Displays information only about the summary LSAs.	
lsa-summary	Displays the total LSA count per advertising router.	
lsa-summary detail	Displays the count of each type of LSAs per advertising router.	
lsa-summary router-id router-id	Displays the count of each type of LSAs for the specified advertising router.	

Command Modes EXEC

Command History	Release	Modification
	Cisco IOS XE Fuji 16.9.2	This command was introduced.

Usage Guidelines

The various forms of this command deliver information about different OSPF link state advertisements.

Examples

The following is sample output from the **showipospfdatabase** command when no arguments or keywords are used:

Device# show ip ospf database						
OSPF Router w	ith id(192.168	.239.66)	(Process ID	300)		
	Displaying	Router L	ink States(A	rea 0.0.0.	0)	
Link ID	ADV Router	Age	Seq#	Checksum	Link count

172.16.244.0	172.16.241.5	1152	0x80000	071 0	x95CB	

The table below describes the significant fields shown in the display.

Table 16: show ip ospf Database Field Descriptions

Field	Description
Link ID	Router ID number.
ADV Router	Advertising router's ID.
Age	Link state age.
Seq#	Link state sequence number (detects old or duplicate link state advertisements).
Checksum	Fletcher checksum of the complete contents of the link state advertisement.
Link count	Number of interfaces detected for router.

The following is sample output from the **showipospfdatabase**command with the **asbr-summary**keyword:

```
Device#show ip ospf database asbr-summary
OSPF Router with id(192.168.239.66) (Process ID 300)
Displaying Summary ASB Link States(Area 0.0.0.0)
LS age: 1463
Options: (No TOS-capability)
LS Type: Summary Links(AS Boundary Router)
Link State ID: 172.16.245.1 (AS Boundary Router address)
Advertising Router: 172.16.241.5
LS Seq Number: 80000072
Checksum: 0x3548
Length: 28
Network Mask: 0.0.0.0 TOS: 0 Metric: 1
```

The table below describes the significant fields shown in the display.

Table 17: show ip ospf database asbr-summary Field Descriptions

Field	Description
OSPF Router with id	Router ID number.
Process ID	OSPF process ID.
LS age	Link state age.
Options	Type of service options (Type 0 only).
LS Type	Link state type.
Link State ID	Link state ID (autonomous system boundary router).
Advertising Router	Advertising router's ID.
LS Seq Number	Link state sequence (detects old or duplicate link state advertisements).
Checksum	LS checksum (Fletcher checksum of the complete contents of the link state advertisement).
Length	Length in bytes of the link state advertisement.
Network Mask	Network mask implemented.
TOS	Type of service.
Metric	Link state metric.

The following is sample output from the **showipospfdatabase**command with the **external**keyword:

```
Device#show ip ospf database external
OSPF Router with id(192.168.239.66) (Autonomous system 300)
                  Displaying AS External Link States
LS age: 280
Options: (No TOS-capability)
LS Type: AS External Link
Link State ID: 10.105.0.0 (External Network Number)
Advertising Router: 172.16.70.6
LS Seq Number: 80000AFD
Checksum: 0xC3A
Length: 36
Network Mask: 255.255.0.0
       Metric Type: 2 (Larger than any link state path)
       TOS: 0
       Metric: 1
       Forward Address: 0.0.0.0
       External Route Tag: 0
```

Field	Description
OSPF Router with id	Router ID number.
Autonomous system	OSPF autonomous system number (OSPF process ID).
LS age	Link state age.
Options	Type of service options (Type 0 only).
LS Type	Link state type.
Link State ID	Link state ID (external network number).
Advertising Router	Advertising router's ID.
LS Seq Number	Link state sequence number (detects old or duplicate link state advertisements).
Checksum	LS checksum (Fletcher checksum of the complete contents of the LSA).
Length	Length in bytes of the link state advertisement.
Network Mask	Network mask implemented.
Metric Type	External Type.
TOS	Type of service.
Metric	Link state metric.
Forward Address	Forwarding address. Data traffic for the advertised destination will be forwarded to this address. If the forwarding address is set to 0.0.0.0, data traffic will be forwarded instead to the advertisement's originator.
External Route Tag	External route tag, a 32-bit field attached to each external route. This is not used by the OSPF protocol itself.

Table 18: show ip ospf database external Field Descriptions

The following is sample output from the **showipospfdatabase**command with the **network**keyword:

```
Device#show ip ospf database network
```

```
OSPF Router with id(192.168.239.66) (Process ID 300)
Displaying Net Link States(Area 0.0.0.0)
LS age: 1367
Options: (No TOS-capability)
LS Type: Network Links
Link State ID: 172.16.1.3 (address of Designated Router)
Advertising Router: 192.168.239.66
LS Seq Number: 800000E7
Checksum: 0x1229
Length: 52
Network Mask: 255.255.05
Attached Router: 192.168.239.66
Attached Router: 172.16.241.5
Attached Router: 172.16.1.1
Attached Router: 172.16.1.5
```

The table below describes the significant fields shown in the display.

Table 19: show ip ospf database network Field Descriptions

Field	Description
OSPF Router with id	Router ID number.
Process ID 300	OSPF process ID.
LS age	Link state age.
Options	Type of service options (Type 0 only).
LS Type:	Link state type.
Link State ID	Link state ID of designated router.
Advertising Router	Advertising router's ID.
LS Seq Number	Link state sequence (detects old or duplicate link state advertisements).
Checksum	LS checksum (Fletcher checksum of the complete contents of the link state advertisement).
Length	Length in bytes of the link state advertisement.
Network Mask	Network mask implemented.
AS Boundary Router	Definition of router type.
Attached Router	List of routers attached to the network, by IP address.

The following is sample output from the **showipospfdatabase**command with the **router**keyword:

```
Device#show ip ospf database router
```

```
OSPF Router with id(192.168.239.66) (Process ID 300)
Displaying Router Link States (Area 0.0.0.0)
LS age: 1176
Options: (No TOS-capability)
LS Type: Router Links
Link State ID: 172.16.21.6
Advertising Router: 172.16.21.6
LS Seq Number: 80002CF6
Checksum: 0x73B7
Length: 120
AS Boundary Router
155 Number of Links: 8
Link connected to: another Router (point-to-point)
(link ID) Neighboring Router ID: 172.16.21.5
(Link Data) Router Interface address: 172.16.21.6
Number of TOS metrics: 0
TOS 0 Metrics: 2
```

Field	Description
OSPF Router with id	Router ID number.
Process ID	OSPF process ID.
LS age	Link state age.
Options	Type of service options (Type 0 only).
LS Type	Link state type.
Link State ID	Link state ID.
Advertising Router	Advertising router's ID.
LS Seq Number	Link state sequence (detects old or duplicate link state advertisements).
Checksum	LS checksum (Fletcher checksum of the complete contents of the link state advertisement).
Length	Length in bytes of the link state advertisement.
AS Boundary Router	Definition of router type.
Number of Links	Number of active links.
link ID	Link type.
Link Data	Router interface address.
TOS	Type of service metric (Type 0 only).

Table 20: show ip ospf database router Field Descriptions

The following is sample output from showipospfdatabasecommand with the summarykeyword:

```
Device#show ip ospf database summary

OSPF Router with id(192.168.239.66) (Process ID 300)

Displaying Summary Net Link States(Area 0.0.0.0)

Field	Description
Area 0 database summary	Area number.
Count	Count of LSAs of the type identified in the first column.
Router	Number of router link state advertisements in that area.
Network	Number of network link state advertisements in that area.
Summary Net	Number of summary link state advertisements in that area.
Summary ASBR	Number of summary autonomous system boundary router (ASBR) link state advertisements in that area.
Type-7 Ext	Type-7 LSA count.
Self-originated Type-7	Self-originated Type-7 LSA.
Opaque Link	Type-9 LSA count.
Opaque Area	Type-10 LSA count
Subtotal	Sum of LSAs for that area.
Delete	Number of link state advertisements that are marked "Deleted" in that area.
Maxage	Number of link state advertisements that are marked "Maxaged" in that area.
Process 1 database summary	Database summary for the process.
Count	Count of LSAs of the type identified in the first column.
Router	Number of router link state advertisements in that process.
Network	Number of network link state advertisements in that process.
Summary Net	Number of summary link state advertisements in that process.
Summary ASBR	Number of summary autonomous system boundary router (ASBR) link state advertisements in that process.
Type-7 Ext	Type-7 LSA count.
Opaque Link	Type-9 LSA count.
Opaque Area	Type-10 LSA count.
Type-5 Ext	Type-5 LSA count.
Self-Originated Type-5	Self-originated Type-5 LSA count.
Opaque AS	Type-11 LSA count.
Total	Sum of LSAs for that process.

Table 22: show ip ospf database database-summary Field Descriptions

Field	Description
Delete	Number of link state advertisements that are marked "Deleted" in that process.
Maxage	Number of link state advertisements that are marked "Maxaged" in that process.

show ip ospf interface

To display interface information related to Open Shortest Path First (OSPF), use the **show ip ospf interface** command in user EXEC or privileged EXEC mode.

show ip [ospf] [process-id] interface [type number] [brief] [multicast] [topology {topology-name
| base}]

type number brief multicast topology topology-name	the specified interface typ (Optional) Interface number for the specified interface	er. If the <i>number</i> argument is included, only information number is included.		
brief multicast	for the specified interface (Optional) Displays brief addresses and masks, and	number is included.		
multicast	addresses and masks, and			
	(Optional) Displays multi-			
topology topology-name		cast information.		
	<i>e</i> (Optional) Displays OSPF-related information about the named topology instance.			
topology base	(Optional) Displays OSPF-related information about the base topology.			
User EXEC (>) Privileged EXEC (#)

In Cisco IOS Release 12.2(33)SRC, the following sample output from the **show ip ospf interface** command displays details about the configured Time-to-Live (TTL) limits:

Device#show ip ospf interface ethernet 0
.
.
.
Strict TTL checking enabled
! or a message similar to the following is displayed
Strict TTL checking enabled, up to 4 hops allowed

•

Table 23: show ip ospf interface Field Descriptions

Field	Description
Ethernet	Status of the physical link and operational status of the protocol.
Process ID	OSPF process ID.
Area	OSPF area.
Cost	Administrative cost assigned to the interface.
State	Operational state of the interface.
Nbrs F/C	OSPF neighbor count.
Internet Address	Interface IP address, subnet mask, and area address.
Topology-MTID	MTR topology Multitopology Identifier (MTID). A number assigned so that the protocol can identify the topology associated with information that it sends to its peers.
Transmit Delay	Transmit delay in seconds, interface state, and device priority.
Designated Router	Designated router ID and respective interface IP address.
Backup Designated router	Backup designated router ID and respective interface IP address.
Timer intervals configured	Configuration of timer intervals.
Hello	Number of seconds until the next hello packet is sent out this interface.
Strict TTL checking enabled	Only one hop is allowed.
Strict TTL checking enabled, up to 4 hops allowed	A set number of hops has been explicitly configured.
Neighbor Count	Count of network neighbors and list of adjacent neighbors.

show ip ospf neighbor

To display Open Shortest Path First (OSPF) neighbor information on a per-interface basis, use the **showipospfneighbor** command in privileged EXEC mode.

show ip ospf neighbor [interface-type interface-number] [neighbor-id] [detail] [summary
[per-instance]]

Syntax Description	interface-type interface-number	(Optional) Type and number associated with a specific OSPF interface.			
	neighbor-id	(Optional) Neighbor hostname or IP address in A.B.C.D format.			
	detail	(Optional) Displa	ys all neighbors give	en in detail (lists all neighbors).	
	summary	(Optional) Displa	ys total number sum	mary of all neighbors.	
	per-instance	(Optional) Displays total number of neighbors in each neighbor state. The output is printed for each configured OSPF instance separately.			
Command Modes	Privileged EXEC (#)				
Command History	Release		Modification		
	Cisco IOS XE Fuji 16.9.2		This command wa	s introduced.	
	summary information for each nei Device#show ip ospf neighbor	-			
	Neighbor ID Pri State 10.199.199.137 1 FULL/DR 172.16.48.1 1 FULL/DR	Dead Time 0:00:31 OTHER 0:00:33 OTHER 0:00:33	Address 192.168.80.37 172.16.48.1 172.16.48.200 172.16.48.189	Interface Ethernet0 Fddi0 Fddi0 Fddi0 Fddi0	
	The following is sample output showing summary information about the neighbor that matches the neighbor ID:				
	Device#show ip ospf neighbor 10.199.199.137				
	Neighbor 10.199.199.137, interface address 192.168.80.37 In the area 0.0.0.0 via interface Ethernet0 Neighbor priority is 1, State is FULL Options 2 Dead timer due in 0:00:32 Link State retransmission due in 0:00:04				

Neighbor 10.199.199.137, interface address 172.16.48.189 In the area 0.0.0.0 via interface Fddi0 Neighbor priority is 5, State is FULL

```
Options 2
Dead timer due in 0:00:32
```

Link State retransmission due in 0:00:03

If you specify the interface along with the neighbor ID, the system displays the neighbors that match the neighbor ID on the interface, as in the following sample display:

Device#show ip ospf neighbor ethernet 0 10.199.199.137
Neighbor 10.199.199.137, interface address 192.168.80.37
In the area 0.0.0.0 via interface Ethernet0
Neighbor priority is 1, State is FULL
Options 2
Dead timer due in 0:00:37
Link State retransmission due in 0:00:04

You can also specify the interface without the neighbor ID to show all neighbors on the specified interface, as in the following sample display:

Device#show ip ospf neighbor fddi 0

ID	Pri	State	Dead Time	Address	Interface
172.16.48.1	1	FULL/DROTHER	0:00:33	172.16.48.1	Fddi0
172.16.48.200	1	FULL/DROTHER	0:00:32	172.16.48.200	Fddi0
10.199.199.137	5	FULL/DR	0:00:32	172.16.48.189	Fddi0

The following is sample output from the show ip ospf neighbor detail command:

```
Device#show ip ospf neighbor detail
```

```
Neighbor 192.168.5.2, interface address 10.225.200.28
In the area 0 via interface GigabitEthernet1/0/0
Neighbor priority is 1, State is FULL, 6 state changes
DR is 10.225.200.28 BDR is 10.225.200.30
Options is 0x42
LLS Options is 0x1 (LR), last OOB-Resync 00:03:08 ago

Index 1/1, retransmission queue length 0, number of retransmission 1
First 0x0(0)/0x0(0) Next 0x0(0)/0x0(0)
Last retransmission scan length is 1, maximum is 1
Last retransmission scan time is 0 msec, maximum is 0 msec
```

The table below describes the significant fields shown in the displays.

Field	Description	
Neighbor	Neighbor router ID.	
interface address	IP address of the interface.	
In the area	Area and interface through which the OSPF neighbor is known.	
Neighbor priority	Router priority of the neighbor and neighbor state.	
State	OSPF state. If one OSPF neighbor has enabled TTL security, the other side of the connection will show the neighbor in the INIT state.	

Table 24: show ip ospf neighbor detail Field Descriptions

Field	Description
state changes	Number of state changes since the neighbor was created. This value can be reset using the clearipospfcountersneighbor command.
DR is	Router ID of the designated router for the interface.
BDR is	Router ID of the backup designated router for the interface.
Options	Hello packet options field contents. (E-bit only. Possible values are 0 and 2; 2 indicates area is not a stub; 0 indicates area is a stub.)
LLS Options, last OOB-Resync	Link-Local Signaling and out-of-band (OOB) link-state database resynchronization performed hours:minutes:seconds ago. This is nonstop forwarding (NSF) information. The field indicates the last successful out-of-band resynchronization with the NSF-capable router.
Dead timer due in	Expected time in hours:minutes:seconds before Cisco IOS software will declare the neighbor dead.
Neighbor is up for	Number of hours:minutes:seconds since the neighbor went into the two-way state.
Index	Neighbor location in the area-wide and autonomous system-wide retransmission queue.
retransmission queue length	Number of elements in the retransmission queue.
number of retransmission	Number of times update packets have been re-sent during flooding.
First	Memory location of the flooding details.
Next	Memory location of the flooding details.
Last retransmission scan length	Number of link state advertisements (LSAs) in the last retransmission packet.
maximum	Maximum number of LSAs sent in any retransmission packet.
Last retransmission scan time	Time taken to build the last retransmission packet.
maximum	Maximum time, in milliseconds, taken to build any retransmission packet.

The following is sample output from the **show ip ospf neighbor** command showing a single line of summary information for each neighbor. If one OSPF neighbor has enabled TTL security, the other side of the connection will show the neighbor in the INIT state.

Device#show ip ospf neighbor

      192.2.15.5 i [20]
```

The following is sample output from the **show ip ospf neighbor summary** command:

Device#show ip ospf neighbor summary

Neighbor summary for all OSPF processes DOWN 0 ATTEMPT 0 INIT 0 2WAY 0 0 EXSTART EXCHANGE 0 LOADING 0 FULL 1 Total count 1 (Undergoing NSF 0)

The following is sample output from the **show ip ospf neighbor summary per-instance** command:

Device#show ip ospf neighbor summary

OSPF Router with ID (1.0.0.10) (Process ID 1)
DOWN 0
ATTEMPT 0
INIT 0
2WAY 0

I

EXSTART EXCHANGE LOADING FULL Total count	0 0 1 1	(Undergoing	NSF	0)		
	Neigh	bor summary	for	all	OSPF	processes
DOWN ATTEMPT INIT 2WAY EXSTART EXCHANGE LOADING	0 0 0 0 0 0					
EOADING FULL Total count	1	(Undergoing	NSF	0)		

Table 25: show ip ospf neighbor summary and show ip ospf neighbor summary per-instance Field Descriptions

Field	Description
DOWN	No information (hellos) has been received from this neighbor, but hello packets can still be sent to the neighbor in this state.
ATTEMPT	This state is only valid for manually configured neighbors in a Non-Broadcast Multi-Access (NBMA) environment. In Attempt state, the router sends unicast hello packets every poll interval to the neighbor, from which hellos have not been received within the dead interval.
INIT	This state specifies that the router has received a hello packet from its neighbor, but the receiving router's ID was not included in the hello packet. When a router receives a hello packet from a neighbor, it should list the sender's router ID in its hello packet as an acknowledgment that it received a valid hello packet.
2WAY	This state designates that bi-directional communication has been established between two routers.
EXSTART	This state is the first step in creating an adjacency between the two neighboring routers. The goal of this step is to decide which router is active, and to decide upon the initial DD sequence number. Neighbor conversations in this state or greater are called adjacencies.
EXCHANGE	In this state, OSPF routers exchange database descriptor (DBD) packets. Database descriptors contain link-state advertisement (LSA) headers only and describe the contents of the entire link-state database. Each DBD packet has a sequence number which can be incremented only by the active router which is explicitly acknowledged by the secondary router. Routers also send link-state request packets and link-state update packets (which contain the entire LSA) in this state. The contents of the DBD received are compared to the information contained in the routers link-state database to check if new or more current link-state information is available with the neighbor.

Field	Description
LOADING	In this state, the actual exchange of link state information occurs. Based on the information provided by the DBDs, routers send link-state request packets. The neighbor then provides the requested link-state information in link-state update packets. During the adjacency, if a device receives an outdated or missing LSA, it requests that LSA by sending a link-state request packet. All link-state update packets are acknowledged.
FULL	In this state, devices are fully adjacent with each other. All the device and network LSAs are exchanged and the devices' databases are fully synchronized.
	Full is the normal state for an OSPF device. If a device is stuck in another state, it's an indication that there are problems in forming adjacencies. The only exception to this is the 2-way state, which is normal in a broadcast network. Devices achieve the full state with their DR and BDR only. Neighbors always see each other as 2-way.

show ip ospf virtual-links

To display parameters and the current state of Open Shortest Path First (OSPF) virtual links, use the **showipospfvirtual-links** command in EXEC mode.

show ip ospf virtual-links

Syntax Description	This command has no arguments or keywords.		
Command Modes	EXEC		
Command History	Release	Modification	
	Cisco IOS XE Fuji 16.9.2	This command was introduced.	
Usage Guidelines	The information displayed by the showipospfv operations.	irtual-links command is useful in debugging OSPF routing	
Examples	The following is sample output from the showi	pospfvirtual-links command:	
	Device# show ip ospf virtual-links Virtual Link to router 192.168.101.2 is Transit area 0.0.0.1, via interface Ethe Transmit Delay is 1 sec, State POINT_TO_ Timer intervals configured, Hello 10, De	ernet0, Cost of using 10 _POINT	

The table below describes the significant fields shown in the display.

Table 26: show ip ospf virtual-links Field Descriptions

Hello due in 0:00:08 Adjacency State FULL

Field	Description
Virtual Link to router 192.168.101.2 is up	Specifies the OSPF neighbor, and if the link to that neighbor is up or down.
Transit area 0.0.0.1	The transit area through which the virtual link is formed.
via interface Ethernet0	The interface through which the virtual link is formed.
Cost of using 10	The cost of reaching the OSPF neighbor through the virtual link.
Transmit Delay is 1 sec	The transmit delay (in seconds) on the virtual link.
State POINT_TO_POINT	The state of the OSPF neighbor.
Timer intervals	The various timer intervals configured for the link.
Hello due in 0:00:08	When the next hello is expected from the neighbor.
Adjacency State FULL	The adjacency state between the neighbors.

summary-address (OSPF)

To create aggregate addresses for Open Shortest Path First (OSPF), use the **summary-address** command in router configuration mode. To restore the default, use the no form of this command.

summary-address commandsummary-address {*ip-address mask* | *prefix mask*} [not-advertise] [tag *tag*] [nssa-only] no summary-address {*ip-address mask* | *prefix mask*} [not-advertise] [tag *tag*] [nssa-only]

	-	T			
Syntax Description	<i>ip-address</i> Summary address designated for a range of addresses.				
	mask	IP subnet mask used for the summary route.			
	prefix	IP route prefix for the destination			
	not-advertise	(Optional) Suppresses routes that r to OSPF only.	natch the specified prefix/mask pair. This keyword applies		
	tag tag	(Optional) Specifies the tag value redistribution via route maps. Thi	that can be used as a "match" value for controlling s keyword applies to OSPF only.		
	nssa-only	(Optional) Sets the nssa-only attribute for the summary route (if any) generated for the specified prefix, which limits the summary to not-so-stubby-area (NSSA) areas.			
Command Default	This command	behavior is disabled by default.			
Command Modes	Router configur	ration			
Command History	Release		Modification		
	Cisco IOS XE	Fuji 16.9.2	This command was introduced.		
Usage Guidelines	R outes learned from other routing protocols can be summarized. The metric used to advertise the summary is the lowest metric of all the more specific routes. This command helps reduce the size of the routing table.				
	Using this command for OSPF causes an OSPF Autonomous System Boundary Router (ASBR) to advertise one external route as an aggregate for all redistributed routes that are covered by the address. For OSPF, this command summarizes only routes from other routing protocols that are being redistributed into OSPF. Use the area range command for route summarization between OSPF areas.				
	OSPF does not	support the summary-address 0.0.	0.0 0.0.0.0 command.		
Examples	In the following example, the summary address 10.1.0.0 includes address 10.1.1.0, 10.1.2.0, 10.1.3.0, and so on. Only the address 10.1.0.0 is advertised in an external link-state advertisement.				

Device(config)#summary-address 10.1.0.0 255.255.0.0

Related Commands

5	Command	Description
	area range	Consolidates and summarizes routes at an area boundary.
	ip ospf authentication-key	Assigns a password to be used by neighboring routers that are using the simple password authentication of OSPF.
	ip ospf message-digest-key	Enables OSPF MD5 authentication.

timers throttle spf

To turn on Open Shortest Path First (OSPF) shortest path first (SPF) throttling, use the **timers throttle spf** command in the appropriate configuration mode. To turn off OSPF SPF throttling, use the **no** form of this command.

timers throttle spf spf-start spf-hold spf-max-wait no timers throttle spf spf-start spf-hold spf-max-wait

Syntax Description	spf-start	Initial delay to schedule an SPF calculation after a change, in milliseconds. Range is from 1 to 600000. In OSPF for IPv6, the default value is 5000.			
	spf-hold	Minimum hold time between two con from 1 to 600000. In OSPF for IPv6,	cutive SPF calculations, in milliseconds. Range is default value is 10,000.		
	spf-max-wait	Maximum wait time between two consecutive SPF calculations, in milliseconds. Range is from 1 to 600000. In OSPF for IPv6, the default value is 10,000.			
Command Default	SPF throttling	is not set.			
Command Modes	Address family configuration (config-router-af) Router address family topology configuration (config-router-af-topology) Router configuration (config-router) OSPF for IPv6 router configuration (config-router)				
Command History	Release		Modification		
	Cisco IOS XE	E Fuji 16.9.2	This command was introduced.		
	<i>spf-start</i> argument. Each consecutive wait interval is two times the current hold level in milliseconds until the wait time reaches the maximum time in milliseconds as specified by the <i>spf-max-wait</i> argument. Subsequent wait times remain at the maximum until the values are reset or a link-state advertisement (LSA) is received between SPF calculations.				
	between SPF calculations.				
	Release 12.2(33)SRB				
	If you plan to configure the Multi-Topology Routing (MTR) feature, you need to enter the timers throttle spf command in router address family topology configuration mode in order to make this OSPF router configuration command become topology-aware.				
	Release 15.2(1)T				
	When you configure the ospfv3 network manet command on any interface attached to the OSPFv3 process, the default values for the <i>spf-start</i> , <i>spf-hold</i> , and the <i>spf-max-wait</i> arguments are reduced to 1000 milliseconds, 1000 milliseconds, and 2000 milliseconds respectively.				
Examples	The following example shows how to configure a router with the delay, hold, and maximum interval values for the timers throttle spf command set at 5, 1000, and 90,000 milliseconds, respectively.				
	router ospf : router-id 10				

log-adjacency-changes
timers throttle spf 5 1000 90000
redistribute static subnets
network 10.21.21.0 0.0.0.255 area 0
network 10.22.22.0 0.0.0.255 area 00

The following example shows how to configure a router using IPv6 with the delay, hold, and maximum interval values for the **timers throttle spf** command set at 500, 1000, and 10,000 milliseconds, respectively.

```
ipv6 router ospf 1
event-log size 10000 one-shot
log-adjacency-changes
timers throttle spf 500 1000 10000
```
