clear vtp counters

To clear the VLAN Trunking Protocol (VTP) and pruning counters, use the **clear vtp counters** command in privileged EXEC mode.

clear vtp counters

Syntax Description	This command has no arguments or keywords.				
Command Modes	nand Modes Privileged EXEC				
Command History	Release	Modification			
	Cisco IOS XE Fuji 16.9.2	This command was introduced.			
Examples	This example shows how to clear the V	TP counters:			
	Device> enable Device# clear vtp counters				
	You can verify that information was del	eted by entering the show vtp counters privileged EXEC			

You can verify that information was deleted by entering the **show vtp counters** privileged EXEC command.

debug sw-vlan

To enable debugging of VLAN manager activities, use the **debug sw-vlan** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug sw-vlan {badpmcookies | cfg-vlan {bootup | cli} | events | ifs | mapping | notification | packets | redundancy | registries | vtp} no debug sw-vlan {badpmcookies | cfg-vlan {bootup | cli} | events | ifs | mapping | notification | packets | redundancy | registries | vtp}

Syntax Description	hadnmaaalriaa	Displays debug messages for VLAN manager incidents of bad port manager cookies.					
Syntax Description	Daupincookies	Displays debug messages for VLAN manager incidents of bad port manager cookies.					
	cfg-vlan	Displays VLAN configuration debug messages.					
	bootup	Displays messages when the switch is booting up.					
	cli	Displays messages when the command-line interface (CLI) is in VLAN configuration mode.					
	events	Displays debug messages for VLAN manager events.					
	ifs	Displays debug messages for the VLAN manager IOS file system (IFS). See debug sw-vlan ifs, on page 5 for more information.					
	mapping	Displays debug messages for VLAN mapping.					
	notification	Displays debug messages for VLAN manager notifications. See debug sw-vlan notification, on page 6 for more information.					
	packets	Displays debug messages for packet handling and encapsulation processes.					
	redundancy	Displays debug messages for VTP VLAN redundancy.					
	registries	Displays debug messages for VLAN manager registries.					
	vtp	Displays debug messages for the VLAN Trunking Protocol (VTP) code. See debug sw-vlan vtp, on page 7 for more information.					
Command Default	Debugging is di	isabled.					
Command Modes	Privileged EXE	C					
Command History	Release	Modification					
	Cisco IOS XE	Fuji 16.9.2This command was introduced.					
Usage Guidelines	The undebug s	w-vlan command is the same as the no debug sw-vlan command.					
Examples	This example sl	nows how to display debug messages for VLAN manager events:					

Device> enable Device# debug sw-vlan events

debug sw-vlan ifs

To enable debugging of the VLAN manager IOS file system (IFS) error tests, use the **debug sw-vlan ifs** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

Syntax Description	open read	Displays VLAN manager l	FS file-read operation debug messages.				
	open write	Displays VLAN manager l	FS file-write operation debug messages.				
	read	Displays file-read operatio 4).	n debug messages for the specified error test (1, 2, 3, or				
	write Displays file-write operation debug messages.						
Command Default	Debuggi	ng is disabled.					
Command Modes	Privilege	ed EXEC					
Command History	Release	;	Modification				
	Cisco IC	OS XE Fuji 16.9.2	This command was introduced.				
Usage Guidelines	The und	lebug sw-vlan ifs command is	the same as the no debug sw-vlan ifs command.				
	word and domain a	d the file version number. Oper	Operation 1 reads the file header, which contains the header verification ratio 2 reads the main body of the file, which contains most of the tion 3 reads type length version (TLV) descriptor structures. Operation				
Examples	This exa	mple shows how to display fil	e-write operation debug messages:				
	Device>	enable debug sw-vlan ifs write					

debug sw-vlan notification

To enable debugging of VLAN manager notifications, use the **debug sw-vlan notification** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug sw-vlan notification {accfwdchange | allowedvlancfgchange | fwdchange | linkchange | modechange | pruningcfgchange | statechange} no debug sw-vlan notification {accfwdchange | allowedvlancfgchange | fwdchange | linkchange | modechange | pruningcfgchange | statechange}

Syntax Description	accfwdchange	Displays debug messages for VLAN manager notification of aggregated access interface spanning-tree forward changes.					
	allowedvlancfgchange	Displays debug messages for VLAN manager notification of changes to the allowed VLAN configuration.					
	fwdchange	Displays debug messages for VLAN manager notification of spanning-tree forwarding changes.					
	linkchange	Displays debug messages for VLAN manager notification of interface link-state changes.					
	modechange	Displays debug messages for VLAN manager notification of interface mode changes.					
	pruningcfgchange	Displays debug messages for VLAN manager notification of changes to the pruning configuration.					
	statechange Displays debug messages for VLAN manager notification of interface state changes						
Command Default	Debugging is disabled.						
Command Modes	Privileged EXEC						
Command History	Release	Modification					
	Cisco IOS XE Fuji 16	.9.2 This command was introduced.					
Usage Guidelines	The undebug sw-vlan notification command is the same as the no debug sw-vlan notification command.						
	stack member, you can	gging on a switch stack, it is enabled only on the active switch. To debug a specific start a CLI session from the active switch by using the session switch privileged EXEC command.					
Examples	This example shows ho mode changes:	ow to display debug messages for VLAN manager notification of interface					
	Device> enable Device# debug sw-vl	an notification					

debug sw-vlan vtp

To enable debugging of the VLAN Trunking Protocol (VTP) code, use the **debug sw-vlan vtp** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

 $\begin{array}{ll} debug \ sw-vlan \ vtp & \{events \ | \ packets \ | \ pruning \ \ [packets \ | \ xmit] \ | \ redundancy \ | \ xmit \} \\ no \ debug \ sw-vlan \ vtp & \{events \ | \ packets \ | \ pruning \ | \ redundancy \ | \ xmit \} \\ \end{array}$

Syntax Description	events	Displays debug messages for general-purpose logic flow and detailed VT messages generated by the VTP_LOG_RUNTIME macro in the VTP code					
	packets	Displays debug messages for the contents of all incoming VTP packets that have been passed into the VTP code from the Cisco IOS VTP platform-dependent layer, except for pruning packets.					
	pruning	Displays debug messages generated by the pruning segment of the VTP code.					
	packets	(Optional) Displays debug messages for the contents of all incoming VTP pruning packets that have been passed into the VTP code from the Cisco IOS VTP platform-dependent layer.					
	xmit	(Optional) Displays debug messages for the contents of all outgoing VTP packets that the VTP code requests the Cisco IOS VTP platform-dependent layer to send.					
	redundancy	Displays debug messages for VTP redundancy.					
	xmit	Displays debug messages for the contents of all outgoing VTP packets that the VTP code requests the Cisco IOS VTP platform-dependent layer to send, except for pruning packets.					
Command Default	Debugging is disabled.						
Command Modes	Privileged EXEC						
Command History	Release	Modification					
	Cisco IOS XE Fuji 16.9.2	This command was introduced.					
Usage Guidelines	The undebug sw-vlan vtp command is the same as the no debug sw-vlan vtp command.						
	If no additional parameters are entered after the pruning keyword, VTP pruning debugging messages appear. They are generated by the VTP_PRUNING_LOG_NOTICE, VTP_PRUNING_LOG_INFO, VTP_PRUNING_LOG_DEBUG, VTP_PRUNING_LOG_ALERT, and VTP_PRUNING_LOG_WARNING macros in the VTP pruning code.						
		on a switch stack, it is enabled only on the active switch. To debug a specific					

Examples

This example shows how to display debug messages for VTP redundancy:

Device> enable Device# debug sw-vlan vtp redundancy

private-vlan

To configure private VLANs and to configure the association between private VLAN primary and secondary VLANs, use the **private-vlan** VLAN configuration command on the switch stack or on a standalone switch. Use the **no** form of this command to return the VLAN to normal VLAN configuration.

private-vlan {association [add | remove] *secondary-vlan-list* | community | isolated | primary} no private-vlan {association | community | isolated | primary}

Syntax Description	association	Creates an association between the primary VLAN and a secondary VLAN.				
	add Associates a secondary VLAN to a primary VLAN.					
	remove	Clears the association between a secondary VLAN and a primary VLAN.				
	secondary-vlan-list	One or more secondary VLANs to be associated with a primary VLAN in a private VLAN.				
	community	Designates the VLAN as a community VLAN.				
	isolated Designates the VLAN as an isolated VLAN.					
	primary Designates the VLAN as a primary VLAN.					
Command Default	The default is to have no private VLANs configured.					
Command Modes	VLAN configuration					
Command History	Release	Modification				
	Cisco IOS XE Fuji	16.9.2This command was introduced.				
Usage Guidelines	Before configuring private VLANs, you must disable VTP (VTP mode transparent). After you configure a private VLAN, you should not change the VTP mode to client or server.					
	VTP does not propagate private VLAN configurations. You must manually configure private VLANs on al switches in the Layer 2 network to merge their Layer 2 databases and to prevent flooding of private VLAN traffic.					
	You cannot include VLAN 1 or VLANs 1002 to 1005 in the private VLAN configuration. Extended VLANs (VLAN IDs 1006 to 4094) can be configured in private VLANs.					
	You can associate a secondary (isolated or community) VLAN with only one primary VLAN. A primary VLAN can have one isolated VLAN and multiple community VLANs associated with it.					
	• A secondary VLAN cannot be configured as a primary VLAN.					
	Tr Secondary VI					

 If you delete either the primary or secondary VLANs, the ports associated with the VLAN become inactive.

A community VLAN carries traffic among community ports and from community ports to the promiscuous ports on the corresponding primary VLAN.

An isolated VLAN is used by isolated ports to communicate with promiscuous ports. It does not carry traffic to other community ports or isolated ports with the same primary VLAN domain.

A primary VLAN is the VLAN that carries traffic from a gateway to customer end stations on private ports.

Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

The private-vlan commands do not take effect until you exit from VLAN configuration mode.

Do not configure private VLAN ports as EtherChannels. While a port is part of the private VLAN configuration, any EtherChannel configuration for it is inactive.

Do not configure a private VLAN as a Remote Switched Port Analyzer (RSPAN) VLAN.

Do not configure a private VLAN as a voice VLAN.

Do not configure fallback bridging on switches with private VLANs.

Although a private VLAN contains more than one VLAN, only one STP instance runs for the entire private VLAN. When a secondary VLAN is associated with the primary VLAN, the STP parameters of the primary VLAN are propagated to the secondary VLAN.

For more information about private VLAN interaction with other features, see the software configuration guide for this release.

This example shows how to configure VLAN 20 as a primary VLAN, VLAN 501 as an isolated VLAN, and VLANs 502 and 503 as community VLANs, and to associate them in a private VLAN:

```
# configure terminal
```

```
(config) # vlan 20
(config-vlan) # private-vlan primary
(config-vlan) # exit
(config) # vlan 501
(config-vlan) # private-vlan isolated
(config-vlan) # exit
(config) # vlan 502
(config-vlan) # private-vlan community
(config-vlan) # exit
(config) # vlan 503
(config-vlan) # private-vlan community
(config-vlan) # private-vlan community
(config-vlan) # exit
(config) # vlan 20
(config-vlan) # private-vlan association 501-503
(config-vlan) # private-vlan association 501-503
```

You can verify your setting by entering the **show vlan private-vlan** or **show interfaces status privileged** EXEC command.

private-vlan mapping

To create a mapping between the primary and the secondary VLANs so that both VLANs share the same primary VLAN switched virtual interface (SVI), use the **private-vlan mapping** interface configuration command on a switch virtual interface (SVI). Use the **no** form of this command to remove private VLAN mappings from the SVI.

private-vlan mapping [add | remove] secondary-vlan-list no private-vlan mapping

Syntax Description	add	(Optional) Maps the secondary VLAN to the primary VLAN SVI.				
	remove	(Optional) Removes the mapping between the secondary VLAN and the primary VLAN SVI.				
	secondary-vlan-list	One or more secondary VLANs to be mapped to the primary VLAN SVI.				
Command Default	and Default No private VLAN SVI mapping is configured.					
Command Modes	Interface configuration					
Command History	Release	Modification				
	Cisco IOS XE Fuji 1	6.9.2This command was introduced.				
Usage Guidelines	The device must be in VTP transparent mode when you configure private VLANs.					
	The SVI of the primary VLAN is created at Layer 3.					
	Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.					
	The <i>secondary-vlan-list</i> argument cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private VLAN ID or a hyphenated range of private VLAN IDs. The list can contain one isolated VLAN and multiple community VLANs.					
	Traffic that is received on the secondary VLAN is routed by the SVI of the primary VLAN.					
	A secondary VLAN can be mapped to only one primary SVI. If you configure the primary VLAN as a secondary VLAN, all SVIs specified in this command are brought down.					
		apping between two VLANs that do not have a valid Layer 2 private VLAN association, ration does not take effect.				
Examples	This example shows	how to map the interface of VLAN 20 to the SVI of VLAN 18:				
	Device# configure Device# interface Device(config-if)# Device(config-vlar	vlan 18 # private-vlan mapping 20				

This example shows how to permit routing of secondary VLAN traffic from secondary VLANs 303 to 305 and 307 through VLAN 20 SVI:

Device# configure terminal Device# interface vlan 20 Device(config-if)# private-vlan mapping 303-305, 307 Device(config-vlan)# end

You can verify your settings by entering the **show interfaces private-vlan mapping** privileged EXEC command.

show interfaces private-vlan mapping

To display private VLAN mapping information for the VLAN switch virtual interfaces (SVIs), use the **show interfaces private-vlan mapping** command in user EXEC or privileged EXEC mode.

show interfaces [interface-id] private-vlan mapping

Syntax Description	interface	<i>interface-id</i> (Optional) ID of the interface for which to display private VLAN mapping information.				
Command Default	None					
Command Modes	User EXI	EC				
	Privilege	d EXEC				
Command History	Release			Modification		
	Cisco IC	OS XE Fuji 10	5.9.2	This command was introduced.		
Examples	This exar	nple shows h	ow to display the informat	ion about the private VLAN mapping:		
			aces private-vlan mappi y VLAN Type	ng		
	vlan2 vlan3	301 302	community community			

show vlan

To display the parameters for all configured VLANs or one VLAN (if the VLAN ID or name is specified) on the switch, use the **show vlan** command in user EXEC mode.

show vlan [brief | group | id *vlan-id* | mtu | name *vlan-name* | private-vlan [type] | remote-span | summary]

Syntax Description	brief	(Optional) Displays one line for each VLAN with the VLAN name, status, and its ports.					
	group	(Optional) Displays information about VLAN groups.					
	id vlan-id	(Optional) Displays information about a single VLAN identified by the VLAN ID number. For <i>vlan-id</i> , the range is 1 to 4094.					
	mtu	(Optional) Displays a list of VLANs and the minimum and maximum transmission unit (MTU) sizes configured on ports in the VLAN.					
	name vlan-name	(Optional) Displays information about a single VLAN identified by the VLAN name. The VLAN name is an ASCII string from 1 to 32 characters.					
	private-vlan	 (Optional) Displays information about configured private VLANs, including primary and secondary VLAN IDs, type (community, isolated, or primary) and ports belonging to the private VLAN. This keyword is only supported if your switch is running the IP services feature set. (Optional) Displays only private VLAN ID and type. 					
	type						
	remote-span	(Optional) Displays information about Remote SPAN (RSPAN) VLANs.					
	summary	(Optional) Displays VLAN summary information.					
-	Note The ifindex keyword is not s	supported, even though it is visible in the command-line help string.					
Command Modes	User EXEC						
Command History	Release	Modification					
	Cisco IOS XE Fuji 16.9.2	This command was introduced.					
Usage Guidelines	have the same MTU. When yes ap	utput, the MTU_Mismatch column shows whether all the ports in the VLAN pears in the column, it means that the VLAN has ports with different MTUs, n a port with a larger MTU to a port with a smaller MTU might be dropped.					

If the VLAN does not have an SVI, the hyphen (-) symbol appears in the SVI_MTU column. If the MTU-Mismatch column displays yes, the names of the ports with the MinMTU and the MaxMTU appear.

If you try to associate a private VLAN secondary VLAN with a primary VLAN before you define the secondary VLAN, the secondary VLAN is not included in the **show vlan private-vlan** command output.

In the **show vlan private-vlan type** command output, a type displayed as normal means a VLAN that has a private VLAN association but is not part of the private VLAN. For example, if you define and associate two VLANs as primary and secondary VLANs and then delete the secondary VLAN configuration without removing the association from the primary VLAN, the VLAN that was the secondary VLAN is shown as normal in the display. In the **show vlan private-vlan** output, the primary and secondary VLAN pair is shown as nonoperational.

Examples

This is an example of output from the **show vlan** command. See the table that follows for descriptions of the fields in the display.

	Name				Sta	tus Po	rts			
1	defau	Lt			act.	Gi Gi Gi Gi Gi Gi Gi Gi Gi Gi Gi	1/0/5 1/0/8 1/0/1 1/0/1 1/0/2 1/0/2 1/0/2 1/0/2 1/0/3 1/0/3 1/0/3 1/0/4 1/0/4	, Gi1/0/3 , Gi1/0/6 , Gi1/0/9 1, Gi1/0/3 4, Gi1/0/3 7, Gi1/0/3 6, Gi1/0/3 9, Gi1/0/3 2, Gi1/0/3 5, Gi1/0/3 8, Gi1/0/3 8, Gi1/0/3 1, Gi1/0/3 7, Gi1/0/3	, Gi1/0, , Gi1/0 12, Gi1 15, Gi1 18, Gi1 21, Gi1 24, Gi1 27, Gi1 30, Gi1 33, Gi1 36, Gi1 39, Gi1 42, Gi1	/7 /10 /0/13 /0/16 /0/19 /0/22 /0/25 /0/28 /0/31 /0/31 /0/34 /0/37 /0/40 /0/43

1005 2000 3000	enet		1500	-	_	-	_	-	0	0

Field	Description
VLAN	VLAN number.
Name	Name, if configured, of the VLAN.
Status	Status of the VLAN (active or suspend).
Ports	Ports that belong to the VLAN.
Туре	Media type of the VLAN.
SAID	Security association ID value for the VLAN.
MTU	Maximum transmission unit size for the VLAN.
Parent	Parent VLAN, if one exists.
RingNo	Ring number for the VLAN, if applicable.
BrdgNo	Bridge number for the VLAN, if applicable.
Stp	Spanning Tree Protocol type used on the VLAN.
BrdgMode	Bridging mode for this VLAN—possible values are source-route bridging (SRB) and source-route transparent (SRT); the default is SRB.
Trans1	Translation bridge 1.
Trans2	Translation bridge 2.
Remote SPAN VLANs	Identifies any RSPAN VLANs that have been configured.

This is an example of output from the show vlan summary command:

Device> show vlan summary

```
Number of existing VLANs: 45Number of existing VTP VLANs: 45Number of existing extended VLANS: 0
```

This is an example of output from the show vlan id command:

	ce# sh Name	ow vlan id	2		Stat	tus	Ports				
2 2 2	VLANO VLANO				act: act:			/7, Gi1/0/8 /1, Gi2/0/2			
VLAN	Туре	SAID	MTU	Parent	RingNo	Bridge	No Stj	p BrdgMode	Trans1	Trans2	
2	enet	100002	1500	-	-	-	-	-	0	0	

Remote SPAN VLANs

Disabled

Disabled

show vtp

To display general information about the VLAN Trunking Protocol (VTP) management domain, status, and counters, use the **show vtp** command in EXEC mode.

show vtp {counters | devices [conflicts] | interface [interface-id] | password | status}

Syntax Description	counters	Displays the VTP statistics f	for the device.
	devices		all VTP version 3 devices in the domain. This device is not running VTP version 3.
	conflicts		ation about VTP version 3 devices that have This command is ignored when the device is off mode.
	interface	Displays VTP status and cor interface.	nfiguration for all interfaces or the specified
	interface-id	(Optional) Interface for which This can be a physical interface	ch to display VTP status and configuration. face or a port channel.
	password	Displays whether the VTP p privileged EXEC mode only	password is configured or not (available in y).
	status	Displays general informatio	on about the VTP management domain status.
Command Modes	User EXEC		
	Privileged EXEC		
Command History	Release		Modification
	Cisco IOS XE Fuji 16.9.2	2	This command was introduced.
	Cisco IOS XE Gibraltar 1	.6.12.4	The show vtp password command output now the password is or is not configured.

This is an example of output from the **show vtp counters** command. The table that follows describes each field in the display.

```
Device> show vtp counters
VTP statistics:
Summary advertisements received : 0
Subset advertisements received : 0
Summary advertisements transmitted : 0
Subset advertisements transmitted : 0
Request advertisements transmitted : 0
Number of config revision errors : 0
Number of config digest errors : 0
Number of V1 summary errors : 0
```

VTP pruning statistics:

Trunk	Join Transmitted	Join Received	Summary advts received from non-pruning-capable device
Gi1/0/47	0	0	0
Gi1/0/48	0	0	0
Gi2/0/1	0	0	0
Gi3/0/2	0	0	0

Table 2: show vtp counters Field Descriptions

Field	Description
Summary advertisements received	Number of summary advertisements received by this device on its trunk ports. Summary advertisements contain the management domain name, the configuration revision number, the update timestamp and identity, the authentication checksum, and the number of subset advertisements to follow.
Subset advertisements received	Number of subset advertisements received by this device on its trunk ports. Subset advertisements contain all the information for one or more VLANs.
Request advertisements received	Number of advertisement requests received by this device on its trunk ports. Advertisement requests normally request information on all VLANs. They can also request information on a subset of VLANs.
Summary advertisements transmitted	Number of summary advertisements sent by this device on its trunk ports. Summary advertisements contain the management domain name, the configuration revision number, the update timestamp and identity, the authentication checksum, and the number of subset advertisements to follow.
Subset advertisements transmitted	Number of subset advertisements sent by this device on its trunk ports. Subset advertisements contain all the information for one or more VLANs.

I

Field	Description
Request advertisements transmitted	Number of advertisement requests sent by this device on its trunk ports. Advertisement requests normally request information on all VLANs. They can also request information on a subset of VLANs.
Number of configuration revision errors	Number of revision errors.
	Whenever you define a new VLAN, delete an existing one, suspend or resume an existing VLAN, or modify the parameters on an existing VLAN, the configuration revision number of the device increments.
	Revision errors increment whenever the device receives an advertisement whose revision number matches the revision number of the device, but the MD5 digest values do not match. This error means that the VTP password in the two devices is different or that the devices have different configurations.
	These errors indicate that the device is filtering incoming advertisements, which causes the VTP database to become unsynchronized across the network.
Number of configuration digest errors	Number of MD5 digest errors.
	Digest errors increment whenever the MD5 digest in the summary packet and the MD5 digest of the received advertisement calculated by the device do not match. This error usually means that the VTP password in the two devices is different. To solve this problem, make sure the VTP password on all devices is the same.
	These errors indicate that the device is filtering incoming advertisements, which causes the VTP database to become unsynchronized across the network.
Number of V1 summary errors	Number of Version 1 errors.
	Version 1 summary errors increment whenever a device in VTP V2 mode receives a VTP Version 1 frame. These errors indicate that at least one neighboring device is either running VTP Version 1 or VTP Version 2 with V2-mode disabled. To solve this problem, change the configuration of the devices in VTP V2-mode to disabled.
Join Transmitted	Number of VTP pruning messages sent on the trunk.

Field	Description
Join Received	Number of VTP pruning messages received on the trunk.
Summary Advts Received from non-pruning-capable device	Number of VTP summary messages received on the trunk from devices that do not support pruning.

This is an example of output from the **show vtp status** command. The table that follows describes each field in the display.

```
Device> show vtp status

Table 3: show vtp status Field Descriptions

Field	Description
VTP Version capable	Displays the VTP versions that are capable of operating on the device.
VTP Version running	Displays the VTP version operating on the device. By default, the device implements Version 1 but can be set to Version 2.
VTP Domain Name	Name that identifies the administrative domain for the device.
VTP Pruning Mode	Displays whether pruning is enabled or disabled. Enabling pruning on a VTP server enables pruning for the entire management domain. Pruning restricts flooded traffic to those trunk links that the traffic must use to access the appropriate network devices.
VTP Traps Generation	Displays whether VTP traps are sent to a network management station.
Device ID	Displays the MAC address of the local device.

I

Field	Description
Configuration last modified	Displays the date and time of the last configuration modification. Displays the IP address of the device that caused the configuration change to the database.
VTP Operating Mode	Displays the VTP operating mode, which can be server, client, or transparent.
	Server —A device in VTP server mode is enabled for VTP and sends advertisements. You can configure VLANs on it. The device guarantees that it can recover all the VLAN information in the current VTP database from NVRAM after reboot. By default, every device is a VTP server.
	Note The device automatically changes from VTP server mode to VTP client mode if it detects a failure while writing the configuration to NVRAM and cannot return to server mode until the NVRAM is functioning.
	Client —A device in VTP client mode is enabled for VTP, can send advertisements, but does not have enough nonvolatile storage to store VLAN configurations. You cannot configure VLANs on it. When a VTP client starts up, it does not send VTP advertisements until it receives advertisements to initialize its VLAN database.
	Transparent —A device in VTP transparent mode is disabled for VTP, does not send or learn from advertisements sent by other devices, and cannot affect VLAN configurations on other devices in the network. The device receives VTP advertisements and forwards them on all trunk ports except the one on which the advertisement was received.
Maximum VLANs Supported Locally	Maximum number of VLANs supported locally.
Number of Existing VLANs	Number of existing VLANs.
Configuration Revision	Current configuration revision number on this device.
MD5 Digest	A 16-byte checksum of the VTP configuration.

switchport mode private-vlan

To configure an interface as either a host private-VLAN port or a promiscuous private-VLAN port, use the **switchport mode private-vlan** command in interface configuration mode. To reset the mode to the appropriate default for the device, use the **no** form of this command.

switchport mode private-vlan {host | promiscuous}
no switchport mode private-vlan

Syntax Description	host Configures the interface as a private-VLAN host port. Host ports belong to private-VLAN secondary VLANs and are either community ports or isolated ports, depending on the VLA to which they belong.				
	promiscuous	Configures the interface a of private-VLAN primar	as a private-VLAN promiscuous port. Promiscuous ports are members y VLANs.		
Command Default None					
Command Modes	Interface configuration				
Command History	Release		Modification		
	Cisco IOS X	KE Fuji 16.9.2	This command was introduced.		
Usage Guidelines	A private-VLAN host or promiscuous port cannot be a Switched Port Analyzer (SPAN) destination port. If you configure a SPAN destination port as a private-VLAN host or promiscuous port, the port becomes inactive.				
	Do not configure private VLAN on ports with these other features:				
	• Dynami	ic-access port VLAN mem	ıbership		
	• Dynami	ic Trunking Protocol (DTP	")		
	• Port Ag	gregation Protocol (PAgP))		
	• Link Ag	ggregation Control Protoco	bl (LACP)		
	 Multicas 	st VLAN Registration (M	VR)		
	• Voice V	LAN			
	While a port	is part of the private-VLA	N configuration, any EtherChannel configuration for it is inactive		
	A private-VL	AN port cannot be a secu	re port and should not be configured as a protected port.		
	For more information about private-VLAN interaction with other features, see the software configuration guide for this release.				
	•••	nd community host ports t	e spanning tree Port Fast and bridge-protocol-data-unit (BPDU) guar o prevent STP loops due to misconfigurations and to speed up STP		
	16		N host nort and way do not configure a sulid misster VI AN accordition		

If you configure a port as a private-VLAN host port and you do not configure a valid private-VLAN association by using the **switchport private-vlan host-association** command, the interface becomes inactive.

If you configure a port as a private-VLAN promiscuous port and you do not configure a valid private VLAN mapping by using theswitchport private-vlan mapping command, the interface becomes inactive.

Examples

This example shows how to configure an interface as a private-VLAN host port and associate it to primary VLAN 20. The interface is a member of secondary isolated VLAN 501 and primary VLAN 20.

(config) # interface gigabitethernet2/0/1
(config-if) # switchport mode private-vlan host
 (config-if) # switchport private-vlan host-association 20 501
 (config-if) # end

This example shows how to configure an interface as a private-VLAN promiscuous port and map it to a private VLAN. The interface is a member of primary VLAN 20 and secondary VLANs 501 to 503 are mapped to it.

```
(config) # interface gigabitethernet2/0/1
(config-if) # switchport mode private-vlan promiscuous
  (config-if) # switchport private-vlan mapping 20 501-503
  (config-if) # end
```

switchport priority extend

To set a port priority for the incoming untagged frames or the priority of frames received by the IP phone connected to the specified port, use the **switchport priority extend** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

switchport priority extend {cos value | trust}
no switchport priority extend

Syntax Description	cos value		verride the IEEE 802.1p priority received from the PC or the attached lass of service (CoS) value. The range is 0 to 7. Seven is the highest	
	trust Sets the IP phone port to trust the IEEE 802.1p priority received from the PC or the a device.			
Command Default	The defa	ault port priority is set to a Co	S value of 0 for untagged frames received on the port.	
Command Modes	Interface	e configuration		
Command History	Release		Modification	
	Cisco I	OS XE Fuji 16.9.2	This command was introduced.	
Usage Guidelines	packets Cisco IP	to instruct the IP phone how to Phone. You must enable CDI	In configure the device to send the Cisco Discovery Protocol (CDP) o send data packets from the device attached to the access port on the P on the device port connected to the Cisco IP Phone to send the CDP is enabled by default globally and on all device interfaces.)	
	You sho	uld configure voice VLAN on	the device access ports.	
		mple shows how to configure t)2.1p priority:	he IP phone connected to the specified port to trust the received	
	Device# Device(<pre>enable configure terminal (config)# interface gigabi (config-if)# switchport pr</pre>		
	You can	verify your settings by entering	ng the show interfaces interface-id switchport privileged	

EXEC command.

switchport trunk

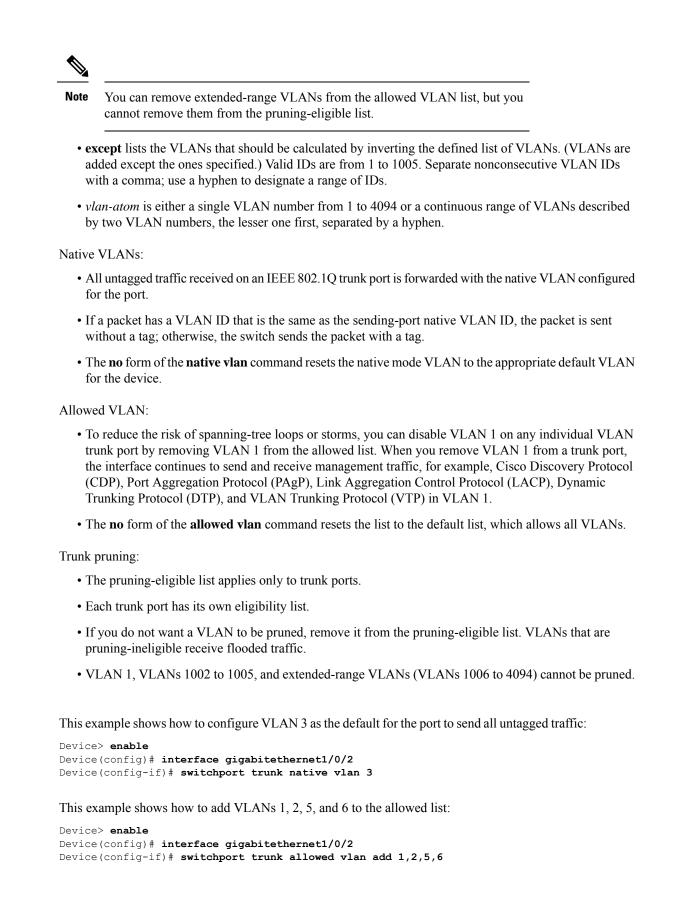

To set the trunk characteristics when the interface is in trunking mode, use the **switchport trunk** command in interface configuration mode. To reset a trunking characteristic to the default, use the **no** form of this command.

switchport trunk {allowed vlan *vlan-list* | native vlan *vlan-id* | pruning vlan *vlan-list*} no switchport trunk {allowed vlan | native vlan | pruning vlan}

Syntax Description	allowed vlan vlan-list	Sets the list of allowed VLANs that can receive and send traffic on this interface in tagged format when in trunking mode. See the Usage Guidelines for the <i>vlan-list</i> choices.			
	native vlan vlan-id	Sets the native VLAN for sending and receiving untagged traffic when the interface is in IEEE 802.1Q trunking mode. The range is 1 to 4094.			
	pruning vlan vlan-list	Sets the list of VLANs that are eligible for VTP pruning when in trunking mode. See the Usage Guidelines for the <i>vlan-list</i> choices.			
Command Default	VLAN 1 is the default na	tive VLAN ID on the port.			
	The default for all VLAN	lists is to include all VLANs.			
Command Modes	Interface configuration				
Command History	Release	Modification			
	Cisco IOS XE Fuji 16.9.	2 This command was introduced.			
Usage Guidelines	The <i>vlan-list</i> format is all	none [add remove except] vlan-atom [,vlan-atom]:			
	• all specifies all VLANs from 1 to 4094. This is the default. This keyword is not allowed on commands that do not permit all VLANs in the list to be set at the same time.				
	• none specifies an empty list. This keyword is not allowed on commands that require certain VLANs to be set or at least one VLAN to be set.				
	• add adds the defined list of VLANs to those currently set instead of replacing the list. Valid IDs are from 1 to 1005; extended-range VLANs (VLAN IDs greater than 1005) are valid in some cases.				
	Note You can add exter pruning-eligible	ended-range VLANs to the allowed VLAN list, but not to the VLAN list.			
	-	utive VLAN IDs with a comma; use a hyphen to designate a range of IDs.			

• **remove** removes the defined list of VLANs from those currently set instead of replacing the list. Valid IDs are from 1 to 1005; extended-range VLAN IDs are valid in some cases.

Examples

This example shows how to remove VLANs 3 and 10 to 15 from the pruning-eligible list:

```
Device> enable
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport trunk pruning vlan remove 3,10-15
```

You can verify your settings by entering the **show interfaces** *interface-id* **switchport** privileged EXEC command.

vlan

I

	To add a VLAN and to enter the VLAN configuration mode, use the vlan command in global configuration mode. To delete the VLAN, use the no form of this command. vlan <i>vlan-id</i> no vlan <i>vlan-id</i>		
Syntax Description	<i>vlan-id</i> ID of the VLAN to be added and configured. The range is 1 to 4094. You can enter a single VLAN ID, a series of VLAN IDs separated by commas, or a range of VLAN IDs separated by hyphens		
Command Default			
Command Modes			
Command History	Release	Modification	
	Cisco IOS XE Fuji 16.9.2	This command was introduced.	
Usage Guidelines	You can use the vlan <i>vlan-id</i> global configuration command to add normal-range VLANs (VLAN IDs 1 to 1005) or extended-range VLANs (VLAN IDs 1006 to 4094). Configuration information for normal-range VLANs is always saved in the VLAN database, and you can display this information by entering the show vlan privileged EXEC command. If the VTP mode is transparent, VLAN configuration information for normal-range vLANs is also saved in the running configuration file. VLAN IDs in the extended range are not saved in the VLAN database, but they are stored in the switch running configuration file, and you can save the configuration in the startup configuration file.		
	VTP version 3 supports propagation of extended-range VLANs. VTP versions 1 and 2 propagate only VLANs 1 to 1005.		
	When you save the VLAN and VTP conconfiguration is selected as follows:	nfigurations in the startup configuration file and reboot the, the	
	• If the VTP mode is transparent in the startup configuration and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.		
	• If the VTP mode or domain name in the startup configuration do not match the VLAN database, the domain name and VTP mode and configuration for VLAN IDs 1 to 1005 use the VLAN database information.		
	If you enter an invalid VLAN ID, you re	eccive an error message and do not enter VLAN configuration mode.	
	ID of an existing VLAN, you do not cre	N ID enables VLAN configuration mode. When you enter the VLAN eate a new VLAN, but you can modify VLAN parameters for that d or modified when you exit the VLAN configuration mode. Only the 1005) takes effect immediately.	

- Note
- Although all commands are visible, the only VLAN configuration command that is supported on extended-range VLANs is **remote-span**. For extended-range VLANs, all other characteristics must remain at the default state.

These configuration commands are available in VLAN configuration mode. The **no** form of each command returns the characteristic to its default state:

- **are** *are-number*—Defines the maximum number of all-routes explorer (ARE) hops for this VLAN. This keyword applies only to TrCRF VLANs. The range is 0 to 13. The default is 7. If no value is entered, 0 is assumed to be the maximum.
- backupcrf—Specifies the backup CRF mode. This keyword applies only to TrCRF VLANs.
 - enable—Backup CRF mode for this VLAN.
 - disable—Backup CRF mode for this VLAN (the default).
- **bridge** {*bridge-number* | **type**}—Specifies the logical distributed source-routing bridge, the bridge that interconnects all logical rings that have this VLAN as a parent VLAN in FDDI-NET, Token Ring-NET, and TrBRF VLANs. The range is 0 to 15. The default bridge number is 0 (no source-routing bridge) for FDDI-NET, TrBRF, and Token Ring-NET VLANs. The **type** keyword applies only to TrCRF VLANs and is one of these:
 - srb—Ssource-route bridging
 - srt—Source-route transparent) bridging VLAN
- exit—Applies changes, increments the VLAN database revision number (VLANs 1 to 1005 only), and exits VLAN configuration mode.
- media—Defines the VLAN media type and is one of these:

- **Note** The supports only Ethernet ports. You configure only FDDI and Token Ring media-specific characteristics for VLAN Trunking Protocol (VTP) global advertisements to other . These VLANs are locally suspended.
 - ethernet—Ethernet media type (the default).
 - fd-net—FDDI network entity title (NET) media type.
 - fddi—FDDI media type.
 - tokenring—Token Ring media type if the VTP v2 mode is disabled, or TrCRF if the VTP Version 2 (v) mode is enabled.
 - **tr-net**—Token Ring network entity title (NET) media type if the VTP v2 mode is disabled or TrBRF media type if the VTP v2 mode is enabled.

See the table that follows for valid commands and syntax for different media types.

• **name** *vlan-name*—Names the VLAN with an ASCII string from 1 to 32 characters that must be unique within the administrative domain. The default is VLANxxxx where xxxx represents four numeric digits (including leading zeros) equal to the VLAN ID number.

- no—Negates a command or returns it to the default setting.
- **parent** *parent-vlan-id*—Specifies the parent VLAN of an existing FDDI, Token Ring, or TrCRF VLAN. This parameter identifies the TrBRF to which a TrCRF belongs and is required when defining a TrCRF. The range is 0 to 1005. The default parent VLAN ID is 0 (no parent VLAN) for FDDI and Token Ring VLANs. For both Token Ring and TrCRF VLANs, the parent VLAN ID must already exist in the database and be associated with a Token Ring-NET or TrBRF VLAN.
- remote-span—Configures the VLAN as a Remote SPAN (RSPAN) VLAN. When the RSPAN feature
 is added to an existing VLAN, the VLAN is first deleted and is then recreated with the RSPAN feature.
 Any access ports are deactivated until the RSPAN feature is removed. If VTP is enabled, the new RSPAN
 VLAN is propagated by VTP for VLAN IDs that are lower than 1024. Learning is disabled on the VLAN.
- **ring** *ring-number*—Defines the logical ring for an FDDI, Token Ring, or TrCRF VLAN. The range is 1 to 4095. The default for Token Ring VLANs is 0. For FDDI VLANs, there is no default.
- said *said-value*—Specifies the security association identifier (SAID) as documented in IEEE 802.10. The range is 1 to 4294967294, and the number must be unique within the administrative domain. The default value is 100000 plus the VLAN ID number.
- shutdown—Shuts down VLAN switching on the VLAN. This command takes effect immediately. Other commands take effect when you exit VLAN configuration mode.
- state—Specifies the VLAN state:
 - active means the VLAN is operational (the default).
 - suspend means the VLAN is suspended. Suspended VLANs do not pass packets.
- ste *ste-number*—Defines the maximum number of spanning-tree explorer (STE) hops. This keyword applies only to TrCRF VLANs. The range is 0 to 13. The default is 7.
- **stp type**—Defines the spanning-tree type for FDDI-NET, Token Ring-NET, or TrBRF VLANs. For FDDI-NET VLANs, the default STP type is ieee. For Token Ring-NET VLANs, the default STP type is ibm. For FDDI and Token Ring VLANs, the default is no type specified.
 - ieee—IEEE Ethernet STP running source-route transparent (SRT) bridging.
 - ibm—IBM STP running source-route bridging (SRB).
 - **auto**—STP running a combination of source-route transparent bridging (IEEE) and source-route bridging (IBM).
- **tb-vlan1** *tb-vlan1-id* and **tb-vlan2** *tb-vlan2-id*—Specifies the first and second VLAN to which this VLAN is translationally bridged. Translational VLANs translate FDDI or Token Ring to Ethernet, for example. The range is 0 to 1005. If no value is specified, 0 (no transitional bridging) is assumed.

Table 4: Valid Commands and Syntax for Different Media Types

Media Type	Valid Syntax
Ethernet	name <i>vlan-name</i> , media ethernet , state { suspend active }, said <i>said-value</i> , remote-span , tb-vlan1 <i>tb-vlan1-id</i> , tb-vlan2 <i>tb-vlan2-id</i>

Media Type	Valid Syntax
FDDI	name vlan-name, media fddi , state { suspend active }, said said-value, ring ring-number, parent parent-vlan-id, tb-vlan1 tb-vlan1-id, tb-vlan2 tb-vlan2-id
FDDI-NET	<pre>name vlan-name, media fd-net , state {suspend active}, said said-value, bridge bridge-number, stp type {ieee ibm auto}, tb-vlan1 tb-vlan1-id, tb-vlan2 tb-vlan2-id</pre>
	If VTP v2 mode is disabled, do not set the stp type to auto.
Token Ring	VTP v1 mode is enabled.
	name vlan-name, media tokenring , state { suspend active }, said said-value, ring ring-number, parent parent-vlan-id, tb-vlan1 tb-vlan1-id, tb-vlan2 tb-vlan2-id
Token Ring concentrator relay function (TrCRF)	VTP v2 mode is enabled.
	name vlan-name, media tokenring, state {suspend active}, said said-value, ring ring-number, parent parent-vlan-id, bridge type {srb srt}, are are-number, ste ste-number, backupcrf {enable disable}, tb-vlan1 tb-vlan1-id, tb-vlan2 tb-vlan2-id
Token Ring-NET	VTP v1 mode is enabled. name vlan-name, media tr-net , state { suspend active }, said said-value, bridge bridge-number, stp type { ieee ibm }, tb-vlan1 tb-vlan1-id, tb-vlan2 tb-vlan2-id
Token Ring bridge relay function (TrBRF)	VTP v2 mode is enabled.
	<pre>name vlan-name, media tr-net, state {suspend active}, said said-value, bridge bridge-number, stp type {ieee ibm auto}, tb-vlan1 tb-vlan1-id, tb-vlan2 tb-vlan2-id</pre>

The following table describes the rules for configuring VLANs:

vlan

L

vlan

Table 5: VLAN Configuration Rules

Configuration	Rule
VTP v2 mode is enabled, and you are configuring a TrCRF VLAN media type.	Specify a parent VLAN ID of a TrBRF that already exists in the database.
	Specify a ring number. Do not leave this field blank.
	Specify unique ring numbers when TrCRF VLANs have the same parent VLAN ID. Only one backup concentrator relay function (CRF) can be enabled.
VTP v2 mode is enabled, and you are configuring VLANs other than TrCRF media type.	Do not specify a backup CRF.
VTP v2 mode is enabled, and you are configuring a TrBRF VLAN media type.	Specify a bridge number. Do not leave this field blank.
VTP v1 mode is enabled.	No VLAN can have an STP type set to auto.
	This rule applies to Ethernet, FDDI, FDDI-NET, Token Ring, and Token Ring-NET VLANs.
Add a VLAN that requires translational bridging (values are not set to zero).	The translational bridging VLAN IDs that are used must already exist in the database.
	The translational bridging VLAN IDs that a configuration points to must also contain a pointer to the original VLAN in one of the translational bridging parameters (for example, Ethernet points to FDDI, and FDDI points to Ethernet).
	The translational bridging VLAN IDs that a configuration points to must be different media types than the original VLAN (for example, Ethernet can point to Token Ring).
	If both translational bridging VLAN IDs are configured, these VLANs must be different media types (for example, Ethernet can point to FDDI and Token Ring).

Examples

This example shows how to add an Ethernet VLAN with default media characteristics. The default includes a *vlan-name* of VLAN *xxxx*, where *xxxx* represents four numeric digits (including leading zeros) equal to the VLAN ID number. The default media is ethernet; the state is active. The default said-value is 100000 plus the VLAN ID; the mtu-size variable is 1500; the stp-type is ieee. When you enter the **exit** VLAN configuration command, the VLAN is added if it did not already exist; otherwise, this command does nothing.

This example shows how to create a new VLAN with all default characteristics and enter VLAN configuration mode:

(config) # vlan 200
(config-vlan) # exit

(config)#

This example shows how to create a new extended-range VLAN with all the default characteristics, to enter VLAN configuration mode, and to save the new VLAN in the startup configuration file:

(config) # vlan 2000 (config-vlan) # end # copy running-config startup config

You can verify your setting by entering the show vlan privileged EXEC command.

vlan dot1q tag native

To enable tagging of native VLAN frames on all IEEE 802.1Q trunk ports, use the **vlan dot1q tag native** command in global configuration mode. To return to the default setting, use the **no** form of this command.

vlan dot1q tag native no vlan dot1q tag native

Syntax Description This command has no arguments or keywords.

Command Default The IEEE 802.1Q native VLAN tagging is disabled.

Command Modes Global configuration

Command History	Release	Modification	
	Cisco IOS XE Fuji 16.9.2	This command was introduced.	
Usage Guidelines	When enabled, native VLAN packets going out of all IEEE 802.1Q trunk ports are tagged.		
	When disabled, native VLAN packets going out of all IEEE 802.1Q trunk ports are not tagged.		
	For more information about IEEE 802.1Q tunneling, see the software configuration guide for this release.		
Examples	This example shows how to enable IEEE 802.1Q tagging on native VLAN frames:		
	Device# configure terminal Device (config)# vlan dot1g tag native		
	Device (config)# end		

You can verify your settings by entering the show vlan dot1q tag native privileged EXEC command.

vtp (global configuration)

To set or modify the VLAN Trunking Protocol (VTP) configuration characteristics, use the **vtp** command in global configuration mode. To remove the settings or to return to the default settings, use the **no** form of this command.

vtp {domain domain-name | file filename | interface interface-name [only] | mode {client | off | server | transparent} [mst | unknown | vlan] | password password [hidden | secret] | pruning | version number} no vtp {file | interface | mode [client | off | server | transparent] [mst | unknown | vlan] | password | pruning | version}

Syntax Description	domain domain-name	Specifies the VTP domain name, an ASCII string from 1 to 32 characters that identifies the VTP administrative domain for the device. The domain name is case sensitive.
	file filename	Specifies the Cisco IOS file system file where the VTP VLAN configuration is stored.
	interface <i>interface-name</i>	Specifies the name of the interface providing the VTP ID updated for this device.
	only	(Optional) Uses only the IP address of this interface as the VTP IP updater.
	mode	Specifies the VTP device mode as client, server, or transparent.
	client	Places the device in VTP client mode. A device in VTP client mode is enabled for VTP, and can send advertisements, but does not have enough nonvolatile storage to store VLAN configurations. You cannot configure VLANs on a VTP client. VLANs are configured on another device in the domain that is in server mode. When a VTP client starts up, it does not send VTP advertisements until it receives advertisements to initialize its VLAN database.
	off	Places the device in VTP off mode. A device in VTP off mode functions the same as a VTP transparent device except that it does not forward VTP advertisements on trunk ports.
	server	Places the device in VTP server mode. A device in VTP server mode is enabled for VTP and sends advertisements. You can configure VLANs on the device. The device can recover all the VLAN information in the current VTP database from nonvolatile storage after reboot.
	transparent	Places the device in VTP transparent mode. A device in VTP transparent mode is disabled for VTP, does not send advertisements or learn from advertisements sent by other devices, and cannot affect VLAN configurations on other devices in the network. The device receives VTP advertisements and forwards them on all trunk ports except the one on which the advertisement was received.
		When VTP mode is transparent, the mode and domain name are saved in the device running configuration file, and you can save them in the device startup configuration file by entering the copy running-config startup config privileged EXEC command.
	mst	(Optional) Sets the mode for the multiple spanning tree (MST) VTP database (only VTP Version 3).

I

	unknown (Optional) Sets the mode for unknown VTP databases (only VTP Version 3).		
	vlan (Optional) Sets the mode for VLAN VTP databases. This is the default (only VTP Version 3).		
	passwordSets the administrative domain password for the generation of the 16-byte secret valuepasswordused in MD5 digest calculation to be sent in VTP advertisements and to validatereceived VTP advertisements. The password can be an ASCII string from 1 to 32characters. The password is case sensitive.		
	hidden	(Optional) Specifies that the key generated from the password string is saved in the VLAN database file. When the hidden password is entered, you need to reenter the password to issue a command in the domain. This keyword is supported only in VTP Version 3.	
	secret	(Optional) Allows the user to directly configure the password secret key (only VTP Version 3).	
	pruningEnables VTP pruning on the device.		
	version number	Sets the VTP Version to Version 1, Version 2, or Version 3.	
Command Default	The default filename is <i>flash:vlan.dat</i> .		
	The default mode is server mode and the default database is VLAN.		
	In VTP Version 3, for the MST database, the default mode is transparent.		
	No domain name or password is defined.		
	No password is configured.		
	Pruning is disabled.		
	The default version is Version 1.		
Command Modes	Global configuration	n	
Command History	Release	Modification	
	Cisco IOS XE Fuji	16.9.2This command was introduced.	
Usage Guidelines	When you save VTP mode, domain name, and VLAN configurations in the device startup configuration file and reboot the device, the VTP and VLAN configurations are selected by these conditions:		
	• If the VTP mode is transparent in the startup configuration and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.		
	• If the VTP mode or domain name in the startup configuration do not match the VLAN database, the domain name and VTP mode and configuration for VLAN IDs 1 to 1005 use the VLAN database information.		

The **vtp file** *filename* cannot be used to load a new database; it renames only the file in which the existing database is stored.

Follow these guidelines when configuring a VTP domain name:

- The device is in the no-management-domain state until you configure a domain name. While in the no-management-domain state, the device does not send any VTP advertisements even if changes occur to the local VLAN configuration. The device leaves the no-management-domain state after it receives the first VTP summary packet on any port that is trunking or after you configure a domain name by using the **vtp domain** command. If the device receives its domain from a summary packet, it resets its configuration revision number to 0. After the device leaves the no-management-domain state, it cannot be configured to reenter it until you clear the NVRAM and reload the software.
- Domain names are case-sensitive.
- After you configure a domain name, it cannot be removed. You can only reassign it to a different domain.

Follow these guidelines when setting VTP mode:

- The no vtp mode command returns the device to VTP server mode.
- The **vtp mode server** command is the same as **no vtp mode** except that it does not return an error if the device is not in client or transparent mode.
- If the receiving device is in client mode, the client device changes its configuration to duplicate the configuration of the server. If you have devices in client mode, be sure to make all VTP or VLAN configuration changes on a device in server mode, as it has a higher VTP configuration revision number. If the receiving device is in transparent mode, the device configuration is not changed.
- A device in transparent mode does not participate in VTP. If you make VTP or VLAN configuration changes on a device in transparent mode, the changes are not propagated to other devices in the network.
- If you change the VTP or VLAN configuration on a device that is in server mode, that change is propagated to all the devices in the same VTP domain.
- The **vtp mode transparent** command disables VTP from the domain but does not remove the domain from the device.
- In VTP Versions 1 and 2, the VTP mode must be transparent for VTP and VLAN information to be saved in the running configuration file.
- With VTP Versions 1 and 2, you cannot change the VTP mode to client or server if extended-range VLANs are configured on the switch. Changing the VTP mode is allowed with extended VLANs in VTP Version 3.
- The VTP mode must be transparent for you to add extended-range VLANs or for VTP and VLAN information to be saved in the running configuration file.
- VTP can be set to either server or client mode only when dynamic VLAN creation is disabled.
- The vtp mode off command sets the device to off. The no vtp mode off command resets the device to the VTP server mode.

Follow these guidelines when setting a VTP password:

- Passwords are case sensitive. Passwords should match on all devices in the same domain.
- When you use the **no vtp password** form of the command, the device returns to the no-password state.

• The **hidden** and **secret** keywords are supported only in VTP Version 3. If you convert from VTP Version 2 to VTP Version 3, you must remove the hidden or secret keyword before the conversion.

Follow these guidelines when setting VTP pruning:

- VTP pruning removes information about each pruning-eligible VLAN from VTP updates if there are no stations belonging to that VLAN.
- If you enable pruning on the VTP server, it is enabled for the entire management domain for VLAN IDs 1 to 1005.
- Only VLANs in the pruning-eligible list can be pruned.
- Pruning is supported with VTP Version 1 and Version 2.

Follow these guidelines when setting the VTP version:

- Toggling the Version 2 (v2) mode state modifies parameters of certain default VLANs.
- Each VTP device automatically detects the capabilities of all the other VTP devices. To use Version 2, all VTP devices in the network must support Version 2; otherwise, you must configure them to operate in VTP Version 1 mode.
- If all devices in a domain are VTP Version 2-capable, you only need to configure Version 2 on one device; the version number is then propagated to the other Version-2 capable devices in the VTP domain.
- If you are using VTP in a Token Ring environment, VTP Version 2 must be enabled.
- If you are configuring a Token Ring bridge relay function (TrBRF) or Token Ring concentrator relay function (TrCRF) VLAN media type, you must use Version 2.
- If you are configuring a Token Ring or Token Ring-NET VLAN media type, you must use Version 1.
- In VTP Version 3, all database VTP information is propagated across the VTP domain, not only VLAN database information.
- Two VTP Version 3 regions can only communicate over a VTP Version 1 or VTP Version 2 region in transparent mode.

You cannot save password, pruning, and version configurations in the device configuration file.

Examples This example shows how to rename the filename for VTP configuration storage to vtpfilename:

Device(config) # vtp file vtpfilename

This example shows how to clear the device storage filename:

```
Device (config) # no vtp file vtpconfig
Clearing device storage filename.
```

This example shows how to specify the name of the interface providing the VTP updater ID for this device:

Device(config) # vtp interface gigabitethernet

This example shows how to set the administrative domain for the device:

Device(config) # vtp domain OurDomainName

This example shows how to place the device in VTP transparent mode: Device(config) # vtp mode transparent

This example shows how to configure the VTP domain password:

Device(config) # vtp password ThisIsOurDomainsPassword

This example shows how to enable pruning in the VLAN database:

Device(config)# **vtp pruning** Pruning switched ON

This example shows how to enable Version 2 mode in the VLAN database:

Device(config) # vtp version 2

You can verify your settings by entering the show vtp status privileged EXEC command.

vtp (interface configuration)

To enable the VLAN Trunking Protocol (VTP) on a per-port basis, use the **vtp** command in interface configuration mode. To disable VTP on the interface, use the **no** form of this command.

	vtp no vtp		
Syntax Description	This command has no arguments or keywords.		
Command Modes	Interface configuration		
Command History	Release	Modification	
	Cisco IOS XE Fuji 16.9.2	This command was introduced.	
Usage Guidelines	Enter this command only on interfaces that are in trunking mode.		
Examples This example shows how to enable VTP on an interface:		TP on an interface:	
	Device> enable Device(config-if)# vtp		
	This example shows how to disable VTP on an interface:		
	Device(config-if)# no vtp		

I

vtp primary

To configure a device as the VLAN Trunking Protocol (VTP) primary server, use the **vtp primary** command in privileged EXEC mode.

vtp primary [mst | vlan] [force]

Syntax Description			
Syntax Description	mst	(Optional) Configures the device as the primary VTP server for the multiple spanning tree (MST) feature.	
	vlan	(Optional) Configures the device as the primary VTP server for VLANs.	
	force	(Optional) Configures the device to not check for conflicting devices when configuring the primary server.	
Command Default	The device is a VTP secondary	/ server.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	Cisco IOS XE Fuji 16.9.2	This command was introduced.	
Usage Guidelines	 A VTP primary server updates the database information and sends updates that are honored by all devices in the system. A VTP secondary server can only back up the updated VTP configurations received from the primary server to NVRAM. By default, all devices come up as secondary servers. Primary server status is needed only for database updates when the administrator issues a takeover message in the domain. You can have a working VTP domain without do		
	any primary servers. Primary server status is lost if the device reloads or domain parameters change.		
	Note This command is supported	ed only when the device is running VTP Version 3.	
Examples	This example shows how to co Device> enable Device# vtp primary vlan Setting device to VTP TRAN	INSPARENT mode.	

You can verify your settings by entering the show vtp status privileged EXEC command.
