# Using the Command-Line Interface

---

This chapter contains the following topics:

- [Using the Command-Line Interface, on page 2](#)

# Using the Command-Line Interface

This chapter describes the command-line interface (CLI) and how to use it to configure your device.

## Understanding Command Modes

The user interface is divided into many different modes. The commands available to you depend on which mode you are currently in. Enter a question mark (?) at the system prompt to obtain a list of commands available for each command mode.

When you start a session on the switch, you begin in user mode, often called user EXEC mode. Only a limited subset of the commands are available in user EXEC mode. For example, most of the user EXEC commands are one-time commands, such as **show** commands, which show the current configuration status, and **clear** commands, which clear counters or interfaces. The user EXEC commands are not saved when the switch reboots.

To have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From this mode, you can enter any privileged EXEC command or enter global configuration mode.

Using the configuration modes (global and interface), you can make changes to the running configuration. If you save the configuration, these commands are stored and used when the device reboots. To access the various configuration modes, you must start at global configuration mode. From global configuration mode, you can enter interface configuration mode and line configuration mode.

This table describes the main command modes, how to access each one, the prompt you see in that mode, and how to exit the mode. The examples in the table use the hostname *Device*.

**Table 1: Command Mode Summary**

| Mode      | Access Method                     | Prompt  | Exit Method                        | About This Mode   |
|-----------|-----------------------------------|---------|------------------------------------|---|
| User EXEC | Begin a session with your device. | Device> | Enter <b>exit</b> or <b>quit</b> . | Use this mode to <ul style="list-style-type: none"> <li>• Change terminal settings.</li> <li>• Perform basic tests.</li> <li>• Display system information.</li> </ul> |

| Mode                             | Access Method  | Prompt                          | Exit Method  | About This Mode  |
|----------------------------------|--|---------------------------------|--|--|
| Privileged EXEC                  | While in user EXEC mode, enter the <b>enable</b> command.  | Device#                         | Enter <b>exit</b> to exit.   | Use this mode to verify commands that you have entered. Use a password to protect access to this mode. |
| Global configuration             | While in privileged EXEC mode, enter the <b>configure</b> command.   | Device(config)#                 | To exit to privileged EXEC mode, enter <b>exit</b> or <b>end</b> , or press <b>Ctrl-Z</b> .  | Use this mode to configure parameters that apply to the entire switch.                                 |
| Ethernet interface configuration | While in global configuration mode, enter the <b>interface ethernet</b> command (with a specific interface). | Device(config-if-ethernet-1/1)# | To exit to global configuration mode, enter <b>exit</b> .<br>To return to privileged EXEC mode, press <b>Ctrl-Z</b> or enter <b>end</b> .            | Use this mode to configure parameters for the Ethernet ports.  |
| VLAN configuration               | While in global configuration mode, enter the <b>vlan vlan-id</b> command.                                   | Device(config-if-vlan)#         | To exit to global configuration mode, enter the <b>exit</b> command.<br>To return to privileged EXEC mode, press <b>Ctrl-Z</b> or enter <b>end</b> . | Use this mode to configure VLAN parameters.  |
| AAA configuration                | While in global configuration mode, enter the <b>aaa</b> command.  | Device(config-aaa) #            | To exit to global configuration mode, enter the <b>exit</b> command.<br>To return to privileged EXEC mode, press <b>Ctrl-Z</b> or enter <b>end</b> . | Use this mode to setup the domain.   |

## Understanding the Help System

| Mode                         | Access Method  | Prompt                                | Exit Method  | About This Mode                                   |
|------------------------------|--|---------------------------------------|--|---|
| RADIUS configuration         | While in global configuration mode, enter the <b>radius host radius-name</b> command.          | Device (config-radius-r1) #           | To exit to global configuration mode, enter the <b>exit</b> command.<br><br>To return to privileged EXEC mode, press <b>Ctrl-Z</b> or enter <b>end</b> . | Use this mode to configure RADIUS parameters.     |
| VLAN interface configuration | While in global configuration mode, enter the <b>interface vlan-interface vlan-id</b> command. | Device (config-if-vlaninterface-22) # | To exit to global configuration mode, enter the <b>exit</b> command.<br><br>To return to privileged EXEC mode, press <b>Ctrl-Z</b> or enter <b>end</b> . | Use this mode to configure VLAN Layer 3 interface |

## Understanding the Help System

You can enter a question mark (?) at the system prompt to display a list of commands available for each command mode. You can also obtain a list of associated keywords and arguments for any command.

**Table 2: Help Summary**

| Command  | Purpose   |
|--|---|
| <b>help</b>  | Obtains a brief description of the help system in any command mode.       |
| <i>abbreviated-command-entry</i> ?<br><br>Device# <b>cl?</b><br>clear clock cls                            | Obtains a list of commands that begin with a particular character string. |
| <i>abbreviated-command-entry</i> <Tab><br><br>Device# <b>sh cl&lt;tab&gt;</b><br>Device# <b>show clock</b> | Completes a partial command name.   |
| ?<br><br>Device> ?   | Lists all commands available for a particular command mode.               |

| Command   | Purpose                                       |
|---|---|
| <code>command ?</code><br><br>Device <code>show ?</code>  | Lists the associated keywords for a command.  |
| <code>command keyword ?</code><br><br>Device(config)# <code>clock timezone</code><br>?<br>STRING<1-32> name of timezone | Lists the associated arguments for a keyword. |

## Understanding Abbreviated Commands

You need to enter only enough characters for the switch to recognize the command as unique.

This example shows how to enter the **show version** command in an abbreviated form:

```
Device# show ver
```

## Understanding no Forms of Commands

Almost every configuration command also has a **no** form. In general, use the **no** form to disable a feature or function or reverse the action of a command. For example, the **no shutdown** interface configuration command reverses the shutdown of an interface. Use the command without the keyword **no** to re-enable a disabled feature or to enable a feature that is disabled by default.

## Understanding CLI Error Messages

This table lists some error messages that you might encounter while using the CLI to configure your device.

*Table 3: Common CLI Error Messages*

| Error Message                           | Meaning  | How to Get Help   |
|---|--|---|
| % Incomplete command.                   | You did not enter all the keywords or values required by this command.           | Re-enter the command followed by a question mark (?) with a space between the command and the question mark.<br><br>The possible keywords that you can enter with the command appear. |
| % Invalid input detected at '^' marker. | You entered the command incorrectly. The caret (^) marks the point of the error. | Enter a question mark (?) to display all the commands that are available in this command mode.<br><br>The possible keywords that you can enter with the command appear.               |

# Using Editing Features

This section describes the editing features that can help you manipulate the command line.

## Editing Commands through Keystrokes

This table shows the keystrokes that you need to edit command lines. These keystrokes are optional.

**Note** The arrow keys function only on ANSI-compatible terminals such as VT100s.

**Table 4: Editing Commands through Keystrokes**

| Capability   | Keystroke   | Purpose  |
|--|---|--|
| Move around the command line to make changes or corrections.   | Press <b>Ctrl-B</b> , or press the left arrow key.  | Moves the cursor back one character.   |
|  | Press <b>Ctrl-F</b> , or press the right arrow key. | Moves the cursor forward one character.  |
|  | Press <b>Ctrl-A</b> .                               | Moves the cursor to the beginning of the command line.   |
|  | Press <b>Ctrl-E</b> .                               | Moves the cursor to the end of the command line.   |
|  | Press <b>Esc B</b> .                                | Moves the cursor back one word.  |
|  | Press <b>Esc F</b> .                                | Moves the cursor forward one word.   |
|  | Press <b>Ctrl-T</b> .                               | Transposes the character to the left of the cursor with the character located at the cursor.   |
| Recall commands from the buffer and paste them in the command line. The switch provides a buffer with the last ten items that you deleted. | Press <b>Ctrl-Y</b> .                               | Recalls the most recent entry in the buffer.   |
|  | Press <b>Esc Y</b> .                                | Recalls the next buffer entry.<br>The buffer contains only the last 10 items that you have deleted or cut. If you press <b>Esc Y</b> more than ten times, you cycle to the first buffer entry. |
| Delete entries if you make a mistake or change your mind.  | Press the <b>Delete</b> or <b>Backspace</b> key.    | Erases the character to the left of the cursor.  |

| Capability   | Keystroke                              | Purpose  |
|--|--|--|
|  | Press <b>Ctrl-D</b> .                  | Deletes the character at the cursor.   |
|  | Press <b>Ctrl-K</b> .                  | Deletes all characters from the cursor to the end of the command line.       |
|  | Press <b>Ctrl-U</b> or <b>Ctrl-X</b> . | Deletes all characters from the cursor to the beginning of the command line. |
|  | Press <b>Ctrl-W</b> .                  | Deletes the word to the left of the cursor.                                  |
|  | Press <b>Esc D</b> .                   | Deletes from the cursor to the end of the word.                              |
| Capitalize or lowercase words or capitalize a set of letters.  | Press <b>Esc C</b> .                   | Capitalizes at the cursor.   |
|  | Press <b>Esc L</b> .                   | Changes the word at the cursor to lowercase.                                 |
|  | Press <b>Esc U</b> .                   | Capitalizes letters from the cursor to the end of the word.                  |
| Designate a particular keystroke as an executable command, perhaps as a shortcut.  | Press <b>Ctrl-V</b> or <b>Esc Q</b> .  |  |
| Scroll down a line or screen on displays that are longer than the terminal screen can display.<br><br><b>Note</b> The More prompt is used for any output that has more lines than can be displayed on the terminal screen, including <b>show</b> command output. You can use the <b>Return</b> and <b>Space</b> bar keystrokes whenever you see the More prompt. | Press the <b>Return</b> key.           | Scrolls down one line.   |
|  | Press the <b>Space</b> bar.            | Scrolls down one screen.   |
| Redisplay the current command line if the switch suddenly sends a message to your screen.  | Press <b>Ctrl-L</b> or <b>Ctrl-R</b> . | Redisplays the current command line.   |

## Editing Command Lines that Wrap

You can use a wraparound feature for commands that extend beyond a single line on the screen. When the cursor reaches the right margin, the command line shifts ten spaces to the left. You cannot see the first ten

## Searching and Filtering Output of show and more Commands

characters of the line, but you can scroll back and check the syntax at the beginning of the command. The keystroke actions are optional.

To scroll back to the beginning of the command entry, press **Ctrl-B** or the left arrow key repeatedly. You can also press **Ctrl-A** to immediately move to the beginning of the line.

---

**Note** The arrow keys function only on ANSI-compatible terminals such as VT100s.

---

In this example, the **access-list** global configuration command entry extends beyond one line. When the cursor first reaches the end of the line, the line is shifted ten spaces to the left and redisplayed. The dollar sign (\$) shows that the line has been scrolled to the left. Each time the cursor reaches the end of the line, the line is again shifted ten spaces to the left.

```
Device(config)# access-list 101 permit tcp 131.108.2.5 255.255.255.0 131.108.1.20 255.25
Device(config)# $ 101 permit tcp 131.108.2.5 255.255.255.0 131.108.1.20 255.25
Device(config)# $t tcp 131.108.2.5 255.255.255.0 131.108.1.20 255.255.255.0 eq
Device(config)# $108.2.5 255.255.255.0 131.108.1.20 255.255.255.0 eq 45
```

After you complete the entry, press **Ctrl-A** to check the complete syntax before pressing the **Return** key to execute the command. The dollar sign (\$) appears at the end of the line to show that the line has been scrolled to the right:

```
Device(config)# access-list 101 permit tcp 131.108.2.5 255.255.255.0 131.108.1.20 255.25
Device(config)# $ 101 permit tcp 131.108.2.5 255.255.255.0 131.108.1.20 255.25
Device(config)# $t tcp 131.108.2.5 255.255.255.0 131.108.1.20 255.255.255.0 eq
Device(config)# $108.2.5 255.255.255.0 131.108.1.20 255.255.255.0 eq 45
```

The software assumes that you have a terminal screen that is 80 columns wide. If you have a width other than that, use the **terminal width** privileged EXEC command to set the width of your terminal.

Use line wrapping with the command history feature to recall and modify previous complex command entries.

## Searching and Filtering Output of show and more Commands

You can search and filter the output for **show** and **more** commands. This is useful when you need to sort through large amounts of output or if you want to exclude output that you do not need to see. Using these commands is optional.

To use this functionality, enter a **show** or **more** command followed by the pipe character (|), one of the keywords **begin**, **include**, or **exclude**, and an expression that you want to search for or filter out:

**command | {begin | include | exclude} regular-expression**

Expressions are case sensitive. For example, if you enter | **exclude output**, the lines that contain *output* are not displayed, but the lines that contain *Output* appear.

This example shows how to include in the output display only lines where the expression *protocol* appears:

```
Device# show interfaces | include protocol
Vlan1 is up, line protocol is up
Vlan10 is up, line protocol is down
GigabitEthernet1/0/1 is up, line protocol is down
GigabitEthernet1/0/2 is up, line protocol is up
```

## Accessing the CLI through a Console Connection or through Telnet

Before you can access the CLI, you must connect a terminal or a PC to the device console or connect a PC to the Ethernet management port and then power on the device, as described in the hardware installation guide that shipped with your device.

CLI access is available before device setup. After your device is configured, you can access the CLI through a remote Telnet session or SSH client.

You can use one of these methods to establish a connection with the device:

- Connect the device console port to a management station or dial-up modem, or connect the Ethernet management port to a PC. For information about connecting to the console or Ethernet management port, see the device hardware installation guide.
- Use any Telnet TCP/IP or encrypted Secure Shell (SSH) package from a remote management station. The device must have network connectivity with the Telnet or SSH client, and the device must have an enable secret password configured.

The device supports up to 16 simultaneous Telnet sessions. Changes made by one Telnet user are reflected in all other Telnet sessions.

The device supports up to five simultaneous secure SSH sessions.

After you connect through the console port, through the Ethernet management port, through a Telnet session or through an SSH session, the user EXEC prompt appears on the management station.

**Accessing the CLI through a Console Connection or through Telnet**

## New and Changed Information

# add inner-vlan

To configure VLAN stacking rule, use the **add inner-vlan** command in VLAN profile configuration mode. To delete the VLAN stacking rule, use the **no add inner-vlan** command.

**add inner-vlan *inner-vlan-id* {priority | outer-vlan *outer-vlan-id* [priority]}**

**no add inner-vlan *inner-vlan-id* [priority]**

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <p><i>inner-vlan-id</i></p> <p>The inner VLAN ID.<br/>The range is from 0 to 4094.</p> |
|                           | <p><i>outer-vlan-id</i></p> <p>The outer VLAN ID.<br/>The range is from 0 to 4094.</p> |
|                           | <p><i>priority</i></p> <p>The 802.1 priority value.<br/>The range is from 0 to 7.</p>  |

**Command Modes** VLAN profile configuration (deploy-profile-vlan)

**Usage Guidelines** A VLAN profile type must be configured.

Modifying and activating the VLAN template will cause the ONT that references the template to go online again.

**Examples** This example shows how to configure VLAN stacking rule.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile vlan
Device(deploy-profile-vlan)# aim 5
Device(deploy-profile-vlan-5)# add inner-vlan 2 3 outer-vlan 2 3
Device(deploy-profile-vlan-5)# active
```

| <b>Related Commands</b> | <b>Command</b>        | <b>Description</b>                |
|-------------------------|-----------------------|-----------------------------------|
|                         | <b>deploy profile</b> | Deploys a profile type            |
|                         | <b>aim</b>            | Creates aim based on the profile. |

# aim

To create profile based aim. use the **aim** command in profile configuration mode.

## For alarm, dba, line, downstream traffic, upstream traffic and VLAN profile configuration modes

**aim {index\_number | name name}**

## For rule and unique profile configuration modes

**aim {slot-num/pon-num/ont-num | name name}**

| Syntax Description | index_number             | The profile index number.<br>The range is from 0 to 1023.   |
|--------------------|--------------------------|---|
|                    | name                     | The profile name.<br>The format is string. The string length range is from 1 to 32.   |
|                    | slot-num/pon-num/ont-num | The ONT ID. <ul style="list-style-type: none"> <li>• <i>slot-num</i>: The slot number. The value is 0.</li> <li>• <i>pon-num</i>: The PON number. The range is from 1 to 1023.</li> <li>• <i>ont-num</i>: The ONT number. The range is from 1 to 1023.</li> </ul> |

|               |  |

```
Device> enable
Device# configure terminal
Device(config)# deploy profile vlan
Device(deploy-profile-vlan)# aim 5
Device(deploy-profile-vlan-5) #
```

## Example

This example shows how to create a unique aim.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile unique
Device(deploy-profile-unique)# aim 0/1/1
Device(deploy-profile-unique-0/1/1) #
```

**Related Commands**

| Command           | Description                |
|-------------------|----------------------------|
| <b>delete aim</b> | Deletes profile based aim. |

alarm ont register-record

# alarm ont register-record

To enable ONT register record alarm and set an alarm threshold, use the **alarm ont register-record** command in global configuration mode. To disable the alarm, use the **no alarm ont register-record** command.

**alarm ont register-record [threshold]*threshold\_value***

**no alarm ont register-record [threshold]*threshold\_value***

| <b>Syntax Description</b>             | <i>threshold_value</i>   | The threshold value.<br>The range is from 1 to 128. The default is 64. |         |             |                                       |  |
|---------------------------------------|--|--|---------|-------------|---------------------------------------|--|
| <b>Command Modes</b>                  | Global configuration (config)  |  |         |             |                                       |  |
| <b>Usage Guidelines</b>               | You can limit the number of ONTs that can be registered on the PON port by setting a threshold value. If the number of ONTs on the PON port exceeds the threshold value, an alarm is generated. The alarm is cancelled once the number of ONTs is less than the threshold value. |  |         |             |                                       |  |
| <b>Examples</b>                       | This example shows how to set an ONT register record alarm threshold value.  |  |         |             |                                       |  |
|                                       | <pre>Device&gt; enable Device# configure terminal Device(config)# alarm ont register-record threshold 80</pre>   |  |         |             |                                       |  |

| <b>show alarm ont register-record</b> | Displays information about register record alarm of an ONT   |  |         |             |                                       |  |

# crypto key

To configure or remove a key, use the **crypto key** command in privileged EXEC mode.

**crypto key {generate rsa | refresh | zeroize rsa}**

|                           |                     |                           |
|---------------------------|---------------------|---------------------------|
| <b>Syntax Description</b> | <b>generate rsa</b> | Configures a default key. |
|                           | <b>refresh</b>      | Activates the key.        |
|                           | <b>zeroize rsa</b>  | Removes the key.          |

**Command Modes** Privileged EXEC (#)

**Usage Guidelines** SSH must be enabled on the device.

**Examples** This example shows how to configure a default key.

```
Device> enable
Device# crypto key generate rsa
Generate default SSH key successfully.
```

This example shows how to activate the key.

```
Device> enable
Device# crypto key refresh
Refresh SSH key successfully.
```

## Example

This example shows how to remove the key.

```
Device> enable
Device# crypto key zeroize rsa
Zeroize SSH key successfully.
```

| Related Commands | Command    | Description            |
|------------------|------------|------------------------|
|                  | <b>ssh</b> | Enables SSH on an OLT. |

**default vlan**

# default vlan

To configure the VLAN tagging rule, use the **default vlan** command in VLAN profile configuration mode. To delete the VLAN tagging rule, use the **no default vlan** command.

**default vlan *vlan\_id* [*priority*]**

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <i>vlan_id</i><br>The VLAN ID.<br>The range is from 1 to 4094. |
| <i>priority</i>           | The 802.1 priority value.<br>The range is from 0 to 7.         |

**Command Modes** VLAN profile configuration (deploy-profile-vlan)

**Usage Guidelines** A VLAN profile type must be configured.

Modifying and activating the VLAN template will cause the ONT that references the template to go online again.

## Examples

This example shows how to configure the VLAN tagging rule.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile vlan
Device(deploy-profile-vlan)# aim 5
Device(deploy-profile-vlan-5)# default vlan 5 5
Device(deploy-profile-vlan-5)# active
```

| <b>Related Commands</b> | <b>Command</b>        | <b>Description</b>                |
|-------------------------|-----------------------|-----------------------------------|
|                         | <b>deploy profile</b> | Deploys a profile type            |
|                         | <b>aim</b>            | Creates aim based on the profile. |

# delete aim

To delete profile based aim, use the **delete aim** command in profile configuration mode.

## For alarm, dba, line, downstream traffic, upstream traffic and VLAN profile configuration modes

**delete aim {profile\_list | name name}**

## For rule and unique profile configuration modes

**delete aim {slot-num/pon-num/ont-num | name name}**

|                           |   |  |
|---------------------------|---|--|
| <b>Syntax Description</b> | <i>index_number</i><br><br><i>name</i><br><br><i>slot-num/pon-num/ont-num</i> | The profile index number.<br>The range is from 0 to 1023.<br><br>The profile name.<br>The format is string. |---------------------------|---|--|

**Command Modes** Profile configuration (deploy-profile)

**Usage Guidelines** A profile type and profile based aim must be created on the device.

**Examples** This example show how to delete a VLAN aim configuration.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile vlan
Device(deploy-profile-vlan)# delete aim 5
```

| Related Commands | Command               | Description                       |
|------------------|-----------------------|-----------------------------------|
|                  | <b>deploy profile</b> | Deploys a profile type            |
|                  | <b>aim</b>            | Creates aim based on the profile. |

# deploy profile

To deploy a profile type, use the **deploy profile** command in global configuration mode.

**deploy profile {alarm | dba | ds-traffic | line | rule | unique | us-traffic | vlan}**

| Syntax Description |                   |                                 |
|--------------------|-------------------|---------------------------------|
|                    | <b>alarm</b>      | The alarm profile.              |
|                    | <b>dba</b>        | The DBA profile.                |
|                    | <b>ds-traffic</b> | The downstream traffic profile. |
|                    | <b>line</b>       | The line profile.               |
|                    | <b>rule</b>       | The rule profile.               |
|                    | <b>unique</b>     | The unique profile.             |
|                    | <b>us-traffic</b> | The upstream traffic profile.   |
|                    | <b>vlan</b>       | The VLAN profile.               |

**Command Modes** Global configuration (config)

## Examples

This example shows how to deploy a line profile.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
```

| Related Commands | Command    | Description                       |
|------------------|------------|-----------------------------------|
|                  | <b>aim</b> | Creates aim based on the profile. |

# description

To configure an ONT description, use the **description** *ont\_description* command in unique profile configuration mode. To delete an ONT description, use the **no description** *ont\_description* command.

**description** *ont\_description*

**no description** *ont\_description*

|                           |  |                      |
|---------------------------|--|----------------------|
| <b>Syntax Description</b> | <i>ont_description</i>                               | The ONT description. |
| <b>Command Modes</b>      | Unique profile configuration (deploy-profile-unique) |                      |
| <b>Usage Guidelines</b>   | A unique profile type must be configured.            |                      |

**Examples** This example shows how to configure an ONT description.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile unique
Device(deploy-profile-unique)# aim 0/1/1
Device(deploy-profile-unique-0/1/1)# description cisco
```

| Related Commands | Command               | Description                       |

| <b>deploy profile</b>     | Deploys a profile type  |  |         |             |                       |                        |            |                                   |
| <b>aim</b>                | Creates aim based on the profile.   |  |         |             |                       |                        |            |                                   |

# ds car bandwidth

To configure committed access rate (CAR) downlink of a GEM port, use the **ds car bandwidth** command in downlink traffic profile configuration mode.

**ds car bandwidth *bandwidth\_rate***

|                           |                       |   |
|---------------------------|-----------------------|---|
| <b>Syntax Description</b> | <i>bandwidth_rate</i> | The downstream bandwidth in kbps.<br>The value range is from 64 to 2608832. |
|---------------------------|-----------------------|---|

|                      |  |
|----------------------|--|
| <b>Command Modes</b> | Downlink traffic profile (deploy-profile-ds-traffic) |
|----------------------|--|

|                         |   |
|-------------------------|---|
| <b>Usage Guidelines</b> | A downlink profile type must be configured. |
|-------------------------|---|

Modifying and activating the downlink traffic profile will cause the ONT that references the template to go online again.

|                 |  |
|-----------------|--|
| <b>Examples</b> | This example shows how to configure a GEM port |
|-----------------|--|

```
Device> enable
Device# configure terminal
Device(config)# deploy profile ds-traffic
Device(deploy-profile-ds-traffic)# aim 5
Device(deploy-profile-ds-traffic-5)# ds car bandwidth 1024
```

| Related Commands | Command               | Description                       |
|------------------|-----------------------|-----------------------------------|
|                  | <b>deploy profile</b> | Deploys a profile type            |
|                  | <b>aim</b>            | Creates aim based on the profile. |

**flow port default**

# flow port default

To create a default flow rule, use the **flow *flow\_id* port {eth *port-id* | veip | iphost} default** command. To delete a default VLAN flow rule, use the **no** form of this command.

**flow *flow\_id* port {eth *port-id* | veip | iphost} default vlan *destination\_vlan\_id* [*priority*]**

**no flow *flow\_id***

|                           |                            |   |
|---------------------------|----------------------------|---|
| <b>Syntax Description</b> | <i>flow_id</i>             | The flow index.<br>The range is from 0 to 63.           |
|                           | <i>port-id</i>             | The ONT Ethernet port ID.<br>The range is from 1 to 24. |
|                           | <b>default</b>             | Specifies the default configuration.                    |
|                           | <i>destination_vlan_id</i> | The destination VLAN ID<br>The range is from 1 to 4094. |
|                           | <i>priority</i>            | The VLAN priority.<br>The range is from 0 to 7.         |

**Command Modes** Line profile configuration (deploy-profile-line)

**Usage Guidelines** A line profile type must be configured.

Modifying and activating the line traffic profile will cause the ONT that references the template to go online again.

**Examples** This example shows how to create a default VLAN flow rule.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# flow 2 port eth 3 default vlan 3 3
```

| <b>Related Commands</b> | <b>Command</b>        | <b>Description</b>                |
|-------------------------|-----------------------|-----------------------------------|
|                         | <b>deploy profile</b> | Deploys a profile type            |
|                         | <b>aim</b>            | Creates aim based on the profile. |

# flow port etype

To create a flow rule based on ethernet frame type, use the **flow *flow\_id* port {eth *port-id* | veip | iphost} etype {arp | ipoe | pppoe} {default *vlan source\_vlan\_id priority* | transparent | *vlan source\_vlan\_id {priority}* | add *vlan destination\_vlan\_id [priority]* | keep | translate *vlan destination\_vlan\_id [priority]*}** command. To delete a flow rule based on ethernet frame type, use the **no** form of this command.

```
flow flow_id port {eth port-id | veip | iphost} etype {arp | ipoe | pppoe} {default vlan source_vlan_id priority | transparent | vlan source_vlan_id {priority} | add vlan destination_vlan_id [priority] | keep | translate vlan destination_vlan_id [priority]}
```

**no flow *flow\_id***

|                           |  |   |
|---------------------------|--|---|
| <b>Syntax Description</b> | <i>flow_id</i>                                   | The flow index.<br>The range is from 0 to 63.           |
|                           | <i>port-id</i>                                   | The ONT Ethernet port ID.<br>The range is from 1 to 24. |
|                           | <b>default</b>                                   | Specifies the default configuration.                    |
|                           | <i>destination_vlan_id</i>                       | The destination VLAN ID<br>The range is from 1 to 4094. |
|                           | <i>priority</i>                                  | The VLAN priority.<br>The range is from 0 to 7.         |
|                           | <b>etype</b>                                     | Specifies user ethernet frame type a                    |
|                           | <b>arp</b>                                       | Specifies ARP as the filter type.                       |
|                           | <b>ipoe</b>                                      | Specifies IPoE as the filter type.                      |
|                           | <b>pppoe</b>                                     | Specifies PPPOE as the filter type.                     |
|                           | <i>source_vlan_id</i>                            | The source VLAN ID<br>The range is from 1 to 4094.      |
|                           | <b>transparent</b>                               | Specifies the service type as transpa                   |
|                           | <b>add</b>                                       | Adds outer service VLAN                                 |
|                           | <b>keep</b>                                      | Adds trunk as the service type.                         |
|                           | <b>translate</b>                                 | Add translate as the service type.                      |
| <b>Command Modes</b>      | Line profile configuration (deploy-profile-line) |   |
| <b>Usage Guidelines</b>   | A line profile type must be configured.          |   |

**flow port etype**

Modifying and activating the line traffic profile will cause the ONT that references the template to go online again.

**Examples**

This example shows how to create a translate flow rule based on ethernet frame type.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# flow 2 port iphost etype arp vlan 3 translate vlan 4 1
```

**Related Commands**

| <b>Command</b>        | <b>Description</b>                |
|-----------------------|-----------------------------------|
| <b>deploy profile</b> | Deploys a profile type            |
| <b>aim</b>            | Creates aim based on the profile. |

# flow port transparent

To create a transparent flow rule, use the **flow *flow\_id* port {eth *port-id* | veip | iphost} transparent** command. To delete a transparent flow rule, use the **no** form of this command.

**flow *flow\_id* port {eth *port-id* | veip | iphost}transparent**

**no flow *flow\_id***

|                           |  |   |
|---------------------------|--|---|
| <b>Syntax Description</b> | <i>flow_id</i><br><br><i>port-id</i><br><br><b>transparent</b> | The flow index.<br>The range is from 0 to 63.<br>The ONT Ethernet port ID.<br>The range is from 1 to 24.<br>Specifies the service type as transpa |
|---------------------------|--|---|

**Command Modes** Line profile configuration (deploy-profile-line)

**Usage Guidelines** A line profile type must be configured.

Modifying and activating the line traffic profile will cause the ONT that references the template to go online again.

**Examples** This example shows how to create a transparent flow rule.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# flow 2 port eth 3 transparent
```

|------------------|-----------------------|-----------------------------------|
|                  | <b>deploy profile</b> | Deploys a profile type            |
|                  | <b>aim</b>            | Creates aim based on the profile. |

# flow port vlan

To create a VLAN flow rule, use the **flow *flow\_id* port {eth *port-id* | veip | iphost} vlan *source\_vlan\_id* {priority|add vlan *destination\_vlan\_id* [*priority*] | keep | translate vlan *destination\_vlan\_id* [*priority*]}** command. To delete a VLAN flow rule, use the **no** form of this command.

```
flow flow_id port {eth port-id | veip | iphost} vlan source_vlan_id {priority|add vlan destination_vlan_id [priority] | keep | translate vlan destination_vlan_id [priority]}
```

```
no flow flow_id
```

|                           |                            |   |
|---------------------------|----------------------------|---|
| <b>Syntax Description</b> | <i>flow_id</i>             | The flow index.<br>The range is from 0 to 63.           |
|                           | <i>port-id</i>             | The ONT Ethernet port ID.<br>The range is from 1 to 24. |
|                           | <i>destination_vlan_id</i> | The destination VLAN ID<br>The range is from 1 to 4094. |
|                           | <i>priority</i>            | The VLAN priority.<br>The range is from 0 to 7.         |
|                           | <i>source_vlan_id</i>      | The source VLAN ID<br>The range is from 1 to 4094.      |
|                           | <b>add</b>                 | Adds outer service VLAN                                 |
|                           | <b>keep</b>                | Adds trunk as the service type.                         |
|                           | <b>translate</b>           | Add translate as the service type.                      |

**Command Modes** Line profile configuration (deploy-profile-line)

**Usage Guidelines** A line profile type must be configured.

Modifying and activating the line traffic profile will cause the ONT that references the template to go online again.

## Examples

This example shows how to create a VLAN keep flow rule.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# flow 2 port eth 3 vlan 2 keep
```

**Related Commands**

| Command               | Description                       |
|-----------------------|-----------------------------------|
| <b>deploy profile</b> | Deploys a profile type            |
| <b>aim</b>            | Creates aim based on the profile. |

# gemport

To create a GEM port and configure the parameters, use the **gemport gem\_index tcont tcont\_id** command in line profile configuration mode.

## For line profile configuration mode

```
gemport gem_index tcont tcont_id { encrypt | vlan-profile | us-traffic-profile | ds-traffic-profile } { index_number | name name }
```

## For unique profile configuration mode.

```
gemport gem_index {vlan-profile | us-traffic-profile | ds-traffic-profile} {index_number | name name}
```

### Syntax Description

|                           |  |
|---------------------------|--|
| <b>gem_index</b>          | The GEM port index number. The range is from 1 to 1024. Current ports can be created in each line profile.         |
| <b>tcont_id</b>           | The T-CONT ID to bind to the GEM port. The range is from 1 to 1024.  |
| <b>encrypt</b>            | Enables Advanced Encryption Standard (AES) encryption.   |
| <b>vlan-profile</b>       | The VLAN profile.  |
| <b>us-traffic-profile</b> | The upstream traffic profile.  |
| <b>ds-traffic-profile</b> | The downstream traffic profile.  |
| <b>index_number</b>       | The index of the template. The range is from 0 to M, where M is the number of ONUs supported by the whole machine. |
| <b>name</b>               | The name of the template.  |

### Command Modes

Line profile configuration (deploy-profile-line)

### Usage Guidelines

A line profile type must be configured.

Modifying and activating the line traffic profile causes the ONT that references the template to go online again.

### Examples

This example shows how to create a gemport and configure a T-CONT to the gemport.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
GPON(deploy-profile-line-5)# device type n40-100-1
GPON(deploy-profile-line-5)# tcont 2 profile dba 1
Device(deploy-profile-line-5)# gemport traffic-mode car
Device(deploy-profile-line-5)# gemport 2 tcont 2 vlan-profile 1
```

| Related Commands | Command                     | Description                       |
|------------------|-----------------------------|-----------------------------------|
|                  | <b>deploy profile</b>       | Deploys a profile type            |
|                  | <b>aim</b>                  | Creates aim based on the profile. |
|                  | <b>gemport traffic-mode</b> | Configures the GEM traffic mode   |

**gemport traffic-mode**

# gemport traffic-mode

To configure the GEM traffic mode, use the **gemport traffic-mode** command in line profile configuration mode.

**gemport traffic-mode {car | queue}**

|                           |                            |  |
|---------------------------|----------------------------|--|
| <b>Syntax Description</b> | <b>car</b><br><b>queue</b> | Specifies committed access rate (CAR) as GEM traffic mode.<br>Specifies priority scheduling queue as GEM traffic mode. |
|---------------------------|----------------------------|--|

|                      |  |

|-------------------------|-----------------------|-----------------------------------|
|                         | <b>deploy profile</b> | Deploys a profile type            |
|                         | <b>aim</b>            | Creates aim based on the profile. |

# load keyfile

To download the key from the external key server, use the **load keyfile** command in privileged EXEC mode.

## Download from a TFTP server

```
load keyfile {public | private} tftp {inet | inet6}server_ip filename
```

## Download from a FTP server

```
load keyfile {public | private} ftp {inet | inet6}server_ip filename username password
```

| Syntax Description | public  | The public SSH key file              |         |             |     |                        |                |  |
|--------------------|---|--------------------------------------|---------|-------------|-----|------------------------|----------------|--|
|                    | private   | The private SSH key file             |         |             |     |                        |                |  |
|                    | tftp  | Loads the file from the TFTP server. |         |             |     |                        |                |  |
|                    | ftp   | Loads the file from FTP server.      |         |             |     |                        |                |  |
|                    | inet  | The IPv4 address family.             |         |             |     |                        |                |  |
|                    | inet6   | The IPv6 address family              |         |             |     |                        |                |  |
|                    | server_ip   | The server IP address                |         |             |     |                        |                |  |
|                    | filename  | The key filename.                    |         |             |     |                        |                |  |
|                    | username  | The FTP username                     |         |             |     |                        |                |  |
|                    | password  | The FTP password.                    |         |             |     |                        |                |  |
| Command Modes      | Privileged EXEC (#)   |                                      |         |             |     |                        |                |  |
| Usage Guidelines   | SSH must be enabled on the device.  |                                      |         |             |     |                        |                |  |
| Examples           | <p>This example shows how to download the public key from the FTP server</p> <pre>Device&gt; enable Device# load keyfile public ftp inet 100.100.100.11 mykey admin 123456</pre>  |                                      |         |             |     |                        |                |  |
| Related Commands   | <table border="1"> <thead> <tr> <th>Command</th><th>Description</th></tr> </thead> <tbody> <tr> <td>ssh</td><td>Enables SSH on an OLT.</td></tr> <tr> <td>upload keyfile</td><td>Uploads the local key to the key server.</td></tr> </tbody> </table> |                                      | Command | Description | ssh | Enables SSH on an OLT. | upload keyfile | Uploads the local key to the key server. |
| Command            | Description   |                                      |         |             |     |                        |                |  |
| ssh                | Enables SSH on an OLT.  |                                      |         |             |     |                        |                |  |
| upload keyfile     | Uploads the local key to the key server.  |                                      |         |             |     |                        |                |  |

# mapping

To create GEM port mapping, use the **mapping index\_number** in line profile configuration mode. To disable GEM port mapping, use the **no mapping index\_number** command.

**mapping index\_number {port {eth port\_id | veip | iphost} | priority priority\_value | vlan vlan\_id }gempport gempport\_index**

**no mapping index\_number**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> |   |
| <i>index_number</i>       | The mapping index number.<br>The value range is from 0 to 47.   |
| <i>port_id</i>            | The ONT Ethernet port ID. The range is from 1 to 24.  |
| <b>eth</b>                | The ONT Ethernet interface. Optional for SFU  |
| <b>veip</b>               | The ONT WAN interface.<br>Optional for HGU  |
| <b>iphost</b>             | The ONT voice IP interface.   |
| <i>gempport_index</i>     | The GEM Port index number.<br>The ranges is from 1 to 1024. Currently, only 24 GEM Ports can be mapped to one line profile. |
| <i>priority</i>           | The 802.1P.<br>The range is from 0 to 7.  |
| <i>vlan_id</i>            | The VLAN ID<br>The range is from 1 to 4094.   |

**Command Modes** Line profile configuration (deploy-profile-line)

**Usage Guidelines** A line profile type must be configured.

Modifying and activating the line traffic profile will cause the ONT that references the template to go online again.

**Examples** This example shows how to create GEM port mapping using ethernet port.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# mapping 2 port eth 3 gempport 3
```

**Related Commands**

| Command               | Description                       |
|-----------------------|-----------------------------------|
| <b>deploy profile</b> | Deploys a profile type            |
| <b>aim</b>            | Creates aim based on the profile. |

# mapping mode

To configure the GEM port mapping mode, use the **mapping mode** command in line profile configuration mode.

**mapping mode {port | port-priority | port-vlan | port-vlan-priority | priority | vlan | vlan-priority}**

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> |  |
| <b>port</b>               | Configures port as the mapping mode.                           |
| <b>port-priority</b>      | Configures port and 802.1p priority as the mapping mode.       |
| <b>port-vlan</b>          | Configures port and VLAN as the mapping mode.                  |
| <b>port-vlan-priority</b> | Configures port, VLAN and 802.1p priority as the mapping mode. |
| <b>priority</b>           | Configures 802.1p priority as the mapping mode.                |
| <b>vlan</b>               | Configures VLAN as the mapping mode.                           |
| <b>vlan-priority</b>      | Configures VLAN and 802.1p priority as the mapping mode.       |

**Command Modes** Line profile configuration (deploy-profile-line)

**Usage Guidelines** A line profile type must be configured.

Modifying and activating the line traffic profile will cause the ONT that references the template to go online again.

**Examples** This example shows how to configure the GEM port mapping mode as VLAN

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# mapping mode vlan
```

| <b>Related Commands</b> | <b>Command</b>        | <b>Description</b>                |
|-------------------------|-----------------------|-----------------------------------|
|                         | <b>deploy profile</b> | Deploys a profile type.           |
|                         | <b>aim</b>            | Creates aim based on the profile. |

# no shutdown

To enable a shutdown port, use the **no shutdown** command in interface configuration mode. To disable a port use the **shutdown** command.

**no shutdown**

**shutdown**

**Command Modes** Interface configuration (config-if)

**Examples** This example shows how to enable a shutdown port.

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 1/1
Device(config-if-ethernet-1/1)# no shutdown
```

**ont-find distance**

# ont-find distance

To configure the ONT logical distance, use the **ont-find distance** command to global configuration mode. To disable the logical distance, use the **no ont-find distance** command.

**ont-find distance min *minimum\_distance* max *maximum\_distance* interface gpon {*slot-number/port-number* | all}**

**no ont-find distance interface gpon {*slot-number/port-number* | all}**

|                           |   |  |
|---------------------------|---|--|
| <b>Syntax Description</b> | <b>min <i>minimum_distance</i></b><br><b>max <i>maximum_distance</i></b><br><b><i>slot-number/port-number</i></b><br><b>all</b> | The minimum distance.<br>The range is from 0 to 40. The default value is 0.<br>The maximum distance.<br>The distance range is from 0 to 60. The default value is 60.<br><i>slot-number/port-number</i> : The port number.<br>• <i>slot-number</i> :<br>• GPON: The value is 0.<br>• GE Ethernet: The value is 1.<br>• 10GE Ethernet: The value is 2.<br><br>• <i>port-number</i> :<br>• GPON: The range is from 0 to 40.<br>• GE Ethernet: The range is from 0 to 60.<br>• 10GE Ethernet: The range is from 0 to 60. |
| <b>Command Modes</b>      | Global configuration (config)   | All ports.   |
| <b>Examples</b>           | This example shows how to configure the ONT logical distance.   |  |

```
Device> enable
Device# configure terminal
Device(config)# ont-find distance min 10 max 30 interface gpon 0/1
Change the logic distance will reset the PON port, are you sure(y/n)?[n]y
Config success: 1, failed: 0.
```

| <b>ont-find distance</b>      | Configures the ONT logical distance.   |  |         |             |                          |                                      |                               |   |                          |  |                             |  |                           |   |
| <b>ont-find interval-time</b> | Configures the auto-discover interval time.  |  |         |             |                          |                                      |                               |   |                          |  |                             |  |                           |   |
| <b>ont-find list-age</b>      | Configures the auto-discover aging time.   |  |         |             |                          |                                      |                               |   |                          |  |                             |  |                           |   |
| <b>show ont-find config</b>   | Displays information about ONT auto find configuration and other related parameters.   |  |         |             |                          |                                      |                               |   |                          |  |                             |  |                           |   |
| <b>show ont-find list</b>     | Displays information about ONT find list.  |  |         |             |                          |                                      |                               |   |                          |  |                             |  |                           |   |

# ont-find interval-time

To configure the auto-discover interval time, use the **ont-find interval-time** command in global configuration mode. To disable the auto-discover interval time, use the **no ont-find interval-time** command.

**ont-find interval-time *interval\_time* interface gpon {slot-number/port-number | all}**

**no ont-find interface gpon {slot-number/port-number | all}**

## Syntax Description

|                                |   |
|--------------------------------|---|
| <i>interval_time</i>           | The interval time. The range is from 3 to 30. The value is in seconds.  |
| <b>all</b>                     | All ports.  |
| <i>slot-number/port-number</i> | <i>slot-number/port-number</i> : The port ID. <ul style="list-style-type: none"><li>• <i>slot-number</i>:<ul style="list-style-type: none"><li>• GPON: The value is 0.</li><li>• GE Ethernet: The value is 1.</li><li>• 10GE Ethernet: The value is 2.</li></ul></li><li>• <i>port-number</i>:<ul style="list-style-type: none"><li>• GPON: The range is from 1 to 8.</li><li>• GE Ethernet: The range is from 1 to 4.</li><li>• 10GE Ethernet: The range is from 1 to 1.</li></ul></li></ul> |

## Command Modes

Global configuration (config)

## Examples

This example shows how to configure the ONT auto-discover interval time.

```
Device> enable
Device# configure terminal
Device(config)# ont-find interval-time 20 interface gpon 0/1
Config success: 1, failed: 0.
```

## Related Commands

| Command                        | Description  |
|--------------------------------|--|
| <b>ont-find interface gpon</b> | Enables auto-discover configuration.   |
| <b>ont-find distance</b>       | Configures the ONT logical distance.   |
| <b>ont-find list-age</b>       | Configures the auto-discover aging time.   |
| <b>show ont-find config</b>    | Displays information about ONT auto find configuration and other related parameters. |
| <b>show ont-find list</b>      | Displays information about ONT find list.  |

# ont-find list-age

To configure the auto-discover aging time, use the **ont-find list-age time** command in global configuration mode. Use the **no ont-find list-age time** command.

**ont-find list-age time *aging\_time* interface gpon {slot-number/port-number | all}**

**no ont-find list-age interface gpon {slot-number/port-number | all}**

| <b>Syntax Description</b>      | <p><i>aging_time</i></p> <p><i>slot-number/port-number</i></p> <p><b>all</b></p>  | <p>The discovery mode timeout time. The unit is hour. **ont auto-config**

# ont auto-config

To enable ONT auto-configuration, use the **ont auto-config** command in global configuration mode. To disable ONT auto-configuration, use the **no ont auto-config** command.

**ont auto-config** [*index\_number name name | name name*] {**all-ont** | **device-type device\_type**}

**no ont auto-config** [*index\_number name name | name name*] {**all-ont** | **device-type device\_type**}

|                           |                                |  |
|---------------------------|--------------------------------|--|
| <b>Syntax Description</b> | <i>index_number</i>            | The index of the template. The range is from 0 to M, where M is the number of ONUs supported by the whole machine. |
|                           | <i>name</i>                    | The name of the template.  |
|                           | <b>all-ont</b>                 | All ONTs.  |
|                           | <b>device-type device_type</b> | The device identifier. The format is in string. The range is 1 to 100.   |

**Command Modes** Global configuration (config)

## Examples

This example shows how to enable auto-configuration.

```
Device> enable
Device# configure terminal
Device(config)# ont auto-config
Device(config)# ont auto-config 1 device-type n40-428-1h line 1
```

# permit loid-lopw

To creates a logical ONT ID and logical ONT ID password permit profile, use the **permit loid-lopw** command in rule profile configuration mode.

```
permit loid-lopw lopw loid line {profile_line_list | name name} {default line {index_number | name name} | once-on {no-aging | aging-time time}}
```

## Syntax Description

|                          |  |
|--------------------------|--|
| <i>lopw</i>              | The logical ONT ID password.                             |
| <i>loid</i>              | The logical ONT ID.                                      |
| <i>profile_line_list</i> | The profile line list number.                            |
| <i>index_number</i>      | The profile index number.                                |
|                          | The range is from 0 to 1023.                             |
| <i>name</i>              | The profile name.  |
|                          | The format is string. The string length is from 1 to 32. |
| <b>no-aging</b>          | Configures no timeout for discovery.                     |
| <b>aging-time time</b>   | Configures timeout for discovery.                        |
|                          | The unit is hour. The range is from 1 to 1000000000.     |

## Command Modes

Rule profile configuration (deploy-profile-rule)

## Usage Guidelines

A rule profile type must be configured.

## Examples

This example shows how to create a logical ONT ID permit profile and logical ONT ID password permit profile.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile rule
Device(deploy-profile-rule)# aim 0/1/1
Device(deploy-profile-rule-0/1/1)# permit loid-lopw logical1 password1 line 1 default line 1 once-on no-aging
```

## Related Commands

| Command               | Description                       |
|-----------------------|-----------------------------------|
| <b>deploy profile</b> | Deploys a profile type            |
| <b>aim</b>            | Creates aim based on the profile. |

**permit loid**

# permit loid

To create a logical ONT ID permit profile, use the **permit loid** command in rule profile configuration mode.

```
permit loid loid line {profile_line_list | name name} {default line {index_number | name name} | once-on {no-aging | aging-time time}}
```

|                           |  |  |

**Usage Guidelines** A rule profile type must be configured.

**Examples** This example shows how to create a logical ONT ID permit profile.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile rule
Device(deploy-profile-rule)# aim 0/1/1
Device(deploy-profile-rule-0/1/1)# permit loid logical line 1 default line 1 once-on
no-aging
```

| Related Commands | Command               | Description                       |
|------------------|-----------------------|-----------------------------------|
|                  | <b>deploy profile</b> | Deploys a profile type            |
|                  | <b>aim</b>            | Creates aim based on the profile. |

# permit lopw

To create a logical ONT ID password permit profile, use the **permit lopw** command in rule profile configuration mode.

```
permit lopw lopw line {profile_line_list | name name} {default line {index_number | name name} | once-on {no-aging | aging-time time}}
```

## Syntax Description

|                          |   |
|--------------------------|---|
| <i>lopw</i>              | The logical ONT ID password.  |
| <i>profile_line_list</i> | The profile line list number.   |
| <i>index_number</i>      | The profile index number.<br>The range is from 0 to 1023.                                 |
| <i>name</i>              | The profile name.<br>The format is string. The string length is from 1 to 32 characters.  |
| <b>no-aging</b>          | Configures no timeout for discovery.  |
| <b>aging-time time</b>   | Configures timeout for discovery.<br>The unit is hour. The range is from 0 to 1000 hours. |

## Command Modes

Rule profile configuration (deploy-profile-rule)

## Examples

This example shows how to create a logical ONT ID password permit profile.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile rule
Device(deploy-profile-rule)# aim 0/1/1
Device(deploy-profile-rule-0/1/1)# permit lopw password1 line 1 default line 1 once-on
no-aging
```

**permit pw**

# permit pw

To create a password permit profile, use the **permit pw** command in rule profile configuration mode.

```
permit pw {string string_password | hex hex_password}line {profile_line_list | name name} {default
line {index_number | name name} | once-on {no-aging | aging-time time}}
```

## Syntax Description

|                          |  |
|--------------------------|--|
| <i>string_password</i>   | The ONT password in Hex.                             |
| <i>hex_password</i>      | The ONT password in string.                          |
| <i>profile_line_list</i> | The profile line list number.                        |
| <i>index_number</i>      | The profile index number.                            |
|                          | The range is from 0 to 1023.                         |
| <i>name</i>              | The profile name.                                    |
|                          | The format is string. The string length              |
| <b>no-aging</b>          | Configures no timeout for discovery mode.            |
| <b>aging-time time</b>   | Configures timeout for discovery mode.               |
|                          | The unit is hour. The range is from 1 to 1000000000. |

## Command Modes

Rule profile configuration (deploy-profile-rule)

## Usage Guidelines

A rule profile type must be configured.

## Examples

This example shows how to create a password permit profile.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile rule
Device(deploy-profile-rule)# aim 0/1/1
Device(deploy-profile-rule-0/1/1)# permit pw string password1 line 1 default line 1
```

## Related Commands

| Command               | Description                       |

| <b>aim</b>            | Creates aim based on the profile. |

# show alarm ont register-record

To display information about register record alarm of an ONT, use the **show alarm ont register-record** command in privileged EXEC or global configuration mode.

## show alarm ont register-record

**Command Modes** Privileged EXEC (#)

Global configuration (config)

**Examples** This example shows how to view information about register record alarm of an ONT

```
Device> enable
Device# configure terminal
Device(config)# show alarm ont register-record
register ont record threshold alarm status : enable
register ont record threshold value      : 64
register ont record current value       :
gpon port 0/1 : 1(normal)
gpon port 0/2 : 0(normal)
gpon port 0/3 : 0(normal)
gpon port 0/4 : 0(normal)
gpon port 0/5 : 0(normal)
gpon port 0/6 : 0(normal)
gpon port 0/7 : 0(normal)
gpon port 0/8 : 0(normal)
```

**show keyfile**

# show keyfile

To display the key file information, use the **show keyfile** command in privileged EXEC or global configuration mode.

**show keyfile {public | private}**

|                           |  |                           |
|---------------------------|--|---------------------------|
| <b>Syntax Description</b> | <b>public</b>  | The SSH public key file.  |
|                           | <b>private</b>   | The SSH private key file. |
| <b>Command Modes</b>      | Privileged EXEC (#)                                      |                           |
|                           | Global configuration (config)                            |                           |
| <b>Examples</b>           | This example shows how to view the key file information  |                           |
|                           | <pre>Device&gt; enable Device# show keyfile public</pre> |                           |

# show ont-find config

To display information about ONT auto find configuration, use the **show ont-find config** command in privileged EXEC or global configuration mode.

**show ont-find config interface gpon {port\_list | all}**

|                           |                  |                |
|---------------------------|------------------|----------------|
| <b>Syntax Description</b> | <i>port_list</i> | The GPON port. |
|                           | <b>all</b>       | All ports.     |

**Command Modes** Privileged EXEC (#)

Global configuration (config)

**Examples** This example shows how to view information about ONT auto find configuration.

```
Device> enable
Device# configure terminal
Device(config)# show ont-find config interface gpon 0/1
Port Find Find-interval Age Aging-time D-min D-max
g0/1 enable 10 enable 600 0 20
```

**show ont-find list**

## show ont-find list

To display information about ONT find list, use the **show ont-find list** command in privileged EXEC or global configuration mode.

```
show ont-find list {interface gpon {slot-number/port-number | all} | sn {string-hex string_serial_number | hex hex_serial_number}}
```

|                           |  |  |
|---------------------------|--|--|
| <b>Syntax Description</b> | <i>slot-number/port-number</i>                       | The port ID.   |

|                           | <b>all</b>   | All ports.   |
|                           | <i>hex_serial_number</i>                             | The ONT serial number in Hex.  |
|                           | <i>string_serial_number</i>                          | The ONT serial number in string.   |
| <b>Command Modes</b>      | Privileged EXEC (#)<br>Global configuration (config) |  |

### Examples

This example shows how to view information about ONT find list

```
Device> enable
Device# configure terminal
Device(config)# show ont-find list interface gpon 0/1
```

# show ont-silent config

To display information about ONT silent function, use the **show ont-silent config** command in privileged EXEC or global configuration mode.

**show ont-silent config interface gpon {port\_list | all}**

|                           |  |                  |                |            |            |
|---------------------------|--|------------------|----------------|------------|------------|
| <b>Syntax Description</b> | <table border="0"> <tr> <td><i>port_list</i></td><td>The GPON port.</td></tr> <tr> <td><b>all</b></td><td>All ports.</td></tr> </table>  | <i>port_list</i> | The GPON port. | <b>all</b> | All ports. |
| <i>port_list</i>          | The GPON port.   |                  |                |            |            |
| <b>all</b>                | All ports.   |                  |                |            |            |
| <b>Command Modes</b>      | Privileged EXEC (#)<br>Global configuration (config)   |                  |                |            |            |
| <b>Examples</b>           | <p>This example shows how to view the information about ONT silent function.</p> <pre>Device&gt; enable Device# configure terminal Device(config)# show ont-silent config interface gpon 0/1 Port  Auth-fail  time  Offline  time g0/1  enable     40    disable   -</pre> |                  |                |            |            |

**show ont-silent list**

## show ont-silent list

To display information about silent ONT, use the **show ont-silent list** command in privileged EXEC or global configuration mode.

```
show ont-silent list {interface gpon {slot-number/port-number | all} | sn {string-hex string_serial_number | hex hex_serial_number}}
```

|                           |  |  |
|---------------------------|--|--|
| <b>Syntax Description</b> | <i>slot-number/port-number</i>                       | The port ID.   |
|                           |  | <ul style="list-style-type: none"> <li>• <i>slot-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The value is 0.</li> <li>• GE Ethernet: The value is 1.</li> <li>• 10GE Ethernet: The value is 10.</li> </ul> </li> <li>• <i>port-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The range is from 1 to 32.</li> <li>• GE Ethernet: The range is from 1 to 32.</li> <li>• 10GE Ethernet: The range is from 1 to 32.</li> </ul> </li> </ul> |
|                           | <b>all</b>   | All ports.   |
|                           | <i>hex_serial_number</i>                             | The ONT serial number in Hex.  |
|                           | <i>string_serial_number</i>                          | The ONT serial number in string.   |
| <b>Command Modes</b>      | Privileged EXEC (#)<br>Global configuration (config) |  |

### Examples

This example shows how to view the information about silent ONT.

```
Device> enable
Device# configure terminal
Device(config)# show ont-silent list interface gpon 0/1
```

# show ont brief count

To display brief information about an ONT interface, use the **show ont brief count** command in privileged EXEC or global configuration mode.

**show ont brief count [interface gpon {slot-number/port-number | all}]**

|                           |  |  |
|---------------------------|--|--|
| <b>Syntax Description</b> | <i>slot-number/port-number</i>   | The port ID.   |
|                           |  | <ul style="list-style-type: none"> <li>• <i>slot-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The value is 0.</li> <li>• GE Ethernet: The value is 1.</li> <li>• 10GE Ethernet: The value is 2.</li> </ul> </li> <li>• <i>port-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The range is from 1 to 32.</li> <li>• GE Ethernet: The range is from 1 to 32.</li> <li>• 10GE Ethernet: The range is from 1 to 8.</li> </ul> </li> </ul> |
|                           | <b>all</b>   | All ports.   |
| <b>Command Modes</b>      | Privileged EXEC (#)  |  |
|                           | Global configuration (config)  |  |
| <b>Examples</b>           | This example shows how to view the brief information about an ONT interface. |  |

```
Device> enable
Device# configure terminal
Device(config)# show ont brief count interface gpon 0/1
Port  Online-num Offline-num Total
g0/1  1        4      5
Total entries: 1.
```

---

**show ont description**

# show ont description

To display the description of an ONT, use the **show ont description** command in privileged EXEC or global configuration mode.

**show ont description** {*slot-num/pon-num/ont-num* | **interface gpon** *slot-number/port-number*}

---

**Syntax Description**

*slot-num/pon-num/ont-num*

The ONT ID.

- *slot-num*: The slot number. The value is 0.
- *pon-num*: The PON number. The range is from 1 to 16.
- *ont-num*: The ONT number. The range is from 1 to 32.

---

*slot-number/port-number*

The port ID.

- *slot-number*:
  - GPON: The value is 0.
  - GE Ethernet: The value is 1.
  - 10GE Ethernet: The value is 2.
- *port-number*:
  - GPON: The range is from 1 to 8.
  - GE Ethernet: The range is from 1 to 4.
  - 10GE Ethernet: The range is from 1 to 2.

---

**Command Modes**

Privileged EXEC (#)

Global configuration (config)

---

**Examples**

This example shows how to view the description of an ONT

```
Device> enable
Device# configure terminal
Device(config)# show ont description interface gpon 0/1
```

# show ont info

To display detailed information about an ONT, use the **show ont info** command in privileged EXEC or global configuration mode.

**show ont info slot-num/pon-num/ont-num**

|                           |                                 |   |
|---------------------------|---------------------------------|---|
| <b>Syntax Description</b> | <i>slot-num/pon-num/ont-num</i> | The ONT ID.   |
|                           |                                 | <ul style="list-style-type: none"> <li>• <i>slot-num</i>: The slot number. The value is 0.</li> <li>• <i>pon-num</i>: The PON number. The range is from 1 to 16.</li> <li>• <i>ont-num</i>: The ONT number. The range is from 1 to 32.</li> </ul> |

|                      |  |
|----------------------|--|
| <b>Command Modes</b> | Privileged EXEC (#)<br>Global configuration (config) |
|----------------------|--|

**Examples** This example shows how to view detailed information about an ONT

```
Device> enable
Device# configure terminal
Device(config)# show ont info 0/1/5
ONT : 0/1/5
Description : -
TYPE : -
Status : online
Distance (m) : 3
Vendor ID : CSCO
Software Version : 1.1.2.5/1.1.2.6
Firmware Version : N40-428-1
Equipment ID : 4GE-POE-2POTS-CATV
SN : GPON-5aa7012a
Password : 123456
LOID : 000a5aa7012a
LOID Password : a7012a
Uplink PON ports : 1
ETH/POTS/TDM/MOCA ports : 4/2/0/0
CATV ANI/UNI ports : 0/1
T-CONTs/GEM ports : 31/127
Traffic Schedulers : 31
PQs in T-CONT 1-8 : 8/8/8/8/8/8/8/8
DBA method : NSR
IP configuration : not support
Type of flow control : GEMPORT CAR and PQ SCHEDULED
TX power cut off : Not Support
Online/Offline time : 05:04:03 2001/12/08
Up/Down time : 1 day(s) 17 hour(s) 34 minute(s)
```

**show ssh**

## show ssh

To display SSH configuration, use the **show ssh** command in privileged EXEC or global configuration mode.

**show ssh**

**Command Modes** Privileged EXEC (#)

Global configuration (config)

### Examples

This example shows how to view the SSH configuration

```
Device> enable  
Device# show ssh  
ssh version : 2.0  
ssh state : on  
ssh key file : available
```

# show ssh limit

To display the maximum number of the users, use the **show ssh limit** command in privileged EXEC or global configuration mode.

## show ssh limit

**Command Modes** Privileged EXEC (#)

Global configuration (config)

**Examples** This example shows how to view the maximum number of the users.

```
Device> enable  
Device# show ssh limit  
SSH user limit is 5, current is 0.
```

**show telnet**

## show telnet

To display the telnet information, use the **show telnet** command in privileged EXEC or global configuration mode.

### show telnet

---

**Command Modes** Privileged EXEC (#)

Global configuration (config)

---

**Examples**

This example shows how to display the telnet information.

```
Device> enable
Device# configure terminal
Device(config)# show telnet
Telnet service port is 23, using port is 23, user limit is 5, current is 1.
```

# sip agent

To configure the SIP proxy server, use the **sip agent proxy-server** command in unique profile configuration mode. To disable the SIP proxy server, use the **no sip agent proxy-server** command.

```
sip agent proxy-server proxy_server_uri {outbound-proxy | registrar-server | signal-port}  
} proxy_server_uri
```

**no sip agent**

|                           |                         |                       |
|---------------------------|-------------------------|-----------------------|
| <b>Syntax Description</b> | <i>proxy_server_uri</i> | The proxy server URI. |
|                           | <b>outbound-proxy</b>   | The outbound proxy.   |
|                           | <b>registrar-server</b> | The registrar server. |
|                           | <b>signal-port</b>      | The signal port.      |

**Command Modes** Unique profile configuration (deploy-profile-unique)

**Usage Guidelines** A unique profile type must be configured.

**Examples** This example shows how to configure the SIP proxy server.

```
Device> enable  
Device# configure terminal  
Device(config)# deploy profile unique  
Device(deploy-profile-unique)# aim 0/1/1  
Device(deploy-profile-unique-0/1/1)# sip agent proxy-server 2
```

| <b>Related Commands</b> | <b>Command</b>        | <b>Description</b>                |
|-------------------------|-----------------------|-----------------------------------|
|                         | <b>deploy profile</b> | Deploys a profile type            |
|                         | <b>aim</b>            | Creates aim based on the profile. |

**sip digitmap**

# sip digitmap

To configure the SIP digit map, use the **sip digitmap** command in unique profile configuration mode.

**sip digitmap dial-plan-id *dial\_plan\_id* dial-plan-token *token***

|                           |                     |   |
|---------------------------|---------------------|---|
| <b>Syntax Description</b> | <i>dial_plan_id</i> | The digit map index<br>The range is from 1 to 10. |
|                           | <i>token</i>        | The token   |

|                      |  |

|                  | <b>deploy profile</b> | Deploys a profile type            |
|                  | <b>aim</b>            | Creates aim based on the profile. |

# sip user

To configure the SIP users, use the **sip user user\_id** command in unique profile configuration mode. To disable SIP users, use the **no sip user user\_id** command.

**sip user pots\_number {name username password password | telno telephone\_number}**

**no sip user pots\_number**

|                           |                         |  |
|---------------------------|-------------------------|--|
| <b>Syntax Description</b> | <i>pots_number</i>      | The ONT POTS port number.<br>The value range is from 1 to 2.     |
|                           | <i>username</i>         | The SIP username.<br>The username length is from 1 to 25.        |
|                           | <i>password</i>         | The SIP password.<br>The password length is from 1 to 25.        |
|                           | <i>telephone_number</i> | The ONT local phone number.<br>The digit length is from 1 to 25. |

**Command Modes** Unique profile configuration (deploy-profile-unique)

**Usage Guidelines** A unique profile type must be configured.

**Examples** This example shows how to configure the SIP users

```
Device> enable
Device# configure terminal
Device(config)# deploy profile unique
Device(deploy-profile-unique)# aim 0/1/1
Device(deploy-profile-unique-0/1/1)# sip user 2 name user 1 password 123
```

| <b>Related Commands</b> | <b>Command</b>        | <b>Description</b>                |
|-------------------------|-----------------------|-----------------------------------|
|                         | <b>deploy profile</b> | Deploys a profile type            |
|                         | <b>aim</b>            | Creates aim based on the profile. |

**sip user mode**

# sip user mode

To configure a SIP interface, use the **sip user mode** command in unique profile configuration mode. To disable a SIP interface, use the **no sip user mode** command.

```
sip user mode { static ip-address ip_address mask mask gateway gateway_address primary-dns primary_dns_address secondary-dns secondary_dns_address | dhcp } vlan vlan_id priority host host_number
```

**no sip user mode**

## Syntax Description

|   |                              |
|---|------------------------------|
| <b>ip-address</b> <i>ip_address</i>               | The IP address               |
| <b>mask</b> <i>mask</i>                           | The IP network mask          |
| <b>gateway</b> <i>gateway_address</i>             | The gateway address          |
| <b>primary-dns</b> <i>primary_dns_address</i>     | The primary DNS address      |
| <b>secondary-dns</b> <i>secondary_dns_address</i> | The secondary DNS address    |
| <b>vlan</b> <i>vlan_id</i>                        | The VLAN ID                  |
| <b>priority</b>                                   | The range is 1-7.            |
| <b>host</b> <i>host_number</i>                    | The host number              |
|   | The host number of the host. |

## Command Modes

Unique profile configuration (deploy-profile-unique)

## Usage Guidelines

A unique profile type must be configured.

## Examples

This example shows how to configure an SIP interface

```
Device> enable
Device# configure terminal
Device(config)# deploy profile unique
Device(deploy-profile-unique)# aim 0/1/1
Device(deploy-profile-unique-0/1/1)# sip user mode dhcp vlan 2 4 host 1
```

## Related Commands

| Command               | Description                       |
|-----------------------|-----------------------------------|
| <b>deploy profile</b> | Deploys a profile type            |
| <b>aim</b>            | Creates aim based on the profile. |

# snmp-server

To enable the snmp server to send traps or disable the snmp server, use the **snmp-server** command in global configuration mode.

**snmp-server {enable | disable}**

|                           |                |  |
|---------------------------|----------------|--|
| <b>Syntax Description</b> | <b>enable</b>  | Enables the snmp server to send traps. |
|                           | <b>disable</b> | Disables the snmp server.              |

**Command Modes** Global configuration (config)

**Examples** This example shows how to disable the snmp server.

```
Device> enable
Device# configure terminal
Device(config)# snmp-server disable
```

# ssh

To enable SSH, use the **ssh** command in global configuration mode. To disable SSH, use the **no ssh** command.

**ssh**

**no ssh**

|                      |                               |

| <b>Related Commands</b>   | <table border="1"> <thead> <tr> <th>Command</th><th>Description</th></tr> </thead> <tbody> <tr> <td><b>telnet enable</b></td><td>Enables Telnet on a OLT and configures the OLT as the Telnet server.</td></tr> </tbody> </table> |  | Command | Description | <b>telnet enable</b> | Enables Telnet on a OLT and configures the OLT as the Telnet server. |
| Command                   | Description   |  |         |             |                      |  |
| <b>telnet enable</b>      | Enables Telnet on a OLT and configures the OLT as the Telnet server.  |  |         |             |                      |  |

# stop vty

To remove logged in users, use the **stop vty** command in privileged EXEC mode.

**stop vty {vty\_list | all}**

| <b>Syntax Description</b> | <p><i>vty_list</i> Users on the vty list only</p> <p><b>all</b> All logged in users.</p>  |         |             |            |                        |
|---------------------------|---|---------|-------------|------------|------------------------|
| <b>Command Modes</b>      | Privileged EXEC (#)   |         |             |            |                        |
| <b>Usage Guidelines</b>   | SSH must be enabled on the device.  |         |             |            |                        |
| <b>Examples</b>           | <p>This example shows how to remove logged in users.</p> <pre>Device&gt; enable Device# stop vty 3</pre>  |         |             |            |                        |
| <b>Related Commands</b>   | <table border="1"> <thead> <tr> <th>Command</th><th>Description</th></tr> </thead> <tbody> <tr> <td><b>ssh</b></td><td>Enables SSH on an OLT.</td></tr> </tbody> </table> | Command | Description | <b>ssh</b> | Enables SSH on an OLT. |
| Command                   | Description   |         |             |            |                        |
| <b>ssh</b>                | Enables SSH on an OLT.  |         |             |            |                        |

**tcont tcont\_id**

## **tcont *tcont\_id***

To create a transmission container (T-CONT), use the **tcont *tcont\_id*** command in line profile configuration mode. To delete a T-CONT, use the **no tcont *tcont\_id*** command.

**tcont *tcont\_id* profile dba {*index\_number* | name *name*}**

**no tcont *tcont\_id***

|                           |                     |  |
|---------------------------|---------------------|--|
| <b>Syntax Description</b> | <i>tcont_id</i>     | The T-CONT ID.<br>The range is from 1 to 8.  |
|                           | <i>index_number</i> | The index of the template. The range is from 0 to M, where M supported by the whole machine. |
|                           | <i>name</i>         | The name of the template.  |

**Command Modes** Line profile configuration (deploy-profile-line)

**Usage Guidelines** A line profile type must be configured.

Modifying and activating the line traffic profile will cause the ONT that references the template to go online again.

**Examples** This example shows how to create a T-CONT.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# tcont 6 profile dba 100
Device(deploy-profile-line-5)# active
```

|                  | <b>telnet disable</b>                        | Disables Telnet on an OLT.                                      |
|                  | <b>telnet limit <i>value</i></b>             | Limits the number of users that can login to the Telnet server. |
|                  | <b>timeout <i>value</i></b>                  | Enables the client timeout and configures the timeout value.    |
|                  | <b>stop telnet client {terminal_id  all}</b> | Removes logged in Telnet clients.                               |

# telnet limit

To limit the number of users that can login to the Telnet server, use the **telnet limit** command in global configuration mode.

**telnet limit value**

| <b>Syntax Description</b> | <i>value</i>  | The limit of the number of users.<br>The range is 0-5. |         |             |                      |  |
|---------------------------|---|--|---------|-------------|----------------------|--|
| <b>Command Modes</b>      | Global configuration (config)   |  |         |             |                      |  |
| <b>Usage Guidelines</b>   | Use this command on the OLT configured as the Telnet server.  |  |         |             |                      |  |
| <b>Examples</b>           | This example shows how to limit the number of users that can login to the Telnet server.  |  |         |             |                      |  |
|                           | <pre>Device&gt; enable Device# configure terminal Device(config)# telnet limit 3</pre>  |  |         |             |                      |  |
| <b>Related Commands</b>   | <table border="1"> <thead> <tr> <th>Command</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><b>telnet enable</b></td> <td>Enables Telnet on a OLT and configures the OLT as the Telnet server.</td> </tr> </tbody> </table> |  | Command | Description | <b>telnet enable</b> | Enables Telnet on a OLT and configures the OLT as the Telnet server. |
| Command                   | Description   |  |         |             |                      |  |
| <b>telnet enable</b>      | Enables Telnet on a OLT and configures the OLT as the Telnet server.  |  |         |             |                      |  |

**telnet server-ip**

# **telnet *server-ip***

To login to the Telnet server, use the **telnet *server-ip*** command in Privileged EXEC mode.

**telnet *server-ip* {*port-number* | /localecho}**

## Syntax Description

|                    |                              |
|--------------------|------------------------------|
| <i>server-ip</i>   | The Telnet server IP address |
| <i>port-number</i> | The port number.             |
| /localecho         |                              |

## Command Modes

Privileged EXEC (#)

## Examples

This example shows how to login to the Telnet server.

```
Device> enable
Device# telnet 100.100.100.1
```

## Related Commands

| Command                                  | Description   |
|--|---|
| <b>telnetclient timeout <i>value</i></b> | Enables client timeout and configures the timeout interval. |

# telnetclient timeout

To enable client timeout , use the **telnetclient timeout** command in global configuration mode. To disable client timeout, use the **no telnetclient timeout** command.

**telnetclient timeout [value]**

**no telnetclient timeout**

|                           |  |  |
|---------------------------|--|--|
| <b>Syntax Description</b> | <i>value</i>   | The system idle timeout value.<br>The unit is minutes. The range is from 1 to 480.           |
| <b>Command Modes</b>      | Global configuration (config)  |  |
| <b>Usage Guidelines</b>   | Use this command on the OLT configured as the Telnet client. To enable client timeout, use the <b>telnetclient timeout</b> command in global configuration mode. To configure the timeout interval, use the <b>telnetclient value</b> command. |  |
| <b>Examples</b>           | This example shows how to enable client timeout.   | <pre>Device&gt; enable Device# configure terminal Device(config)# telnetclient timeout</pre> |

# translate old-vlan

To configure the VLAN translate rule, use the **translate old-vlan** command in VLAN profile configuration mode. To disable the **no translate old-vlan** command.

**translate old-vlan *vlan\_id* {*priority* | new-vlan *vlan\_id* [*priority*]}**

**no translate old-vlan *vlan\_id* [*priority*]**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <p><i>priority</i></p> <p>The priority value.<br/>The range is from 0 to 7.</p> |
|                           | <p><i>vlan_id</i></p> <p>The VLAN ID<br/>The range is from 1 to 4094.</p>       |

|                      |  |
|----------------------|--|
| <b>Command Modes</b> | VLAN profile configuration (deploy-profile-vlan) |
|----------------------|--|

|                         |   |
|-------------------------|---|
| <b>Usage Guidelines</b> | A VLAN profile type must be configured.<br><br>Modifying and activating the VLAN template will cause the ONT that references the template to go online again. |
|-------------------------|---|

|                 |   |
|-----------------|---|
| <b>Examples</b> | This example shows how to configure the VLAN translate rule |
|-----------------|---|

```
Device> enable
Device# configure terminal
Device(config)# deploy profile vlan
Device(deploy-profile-vlan)# aim 5
Device(deploy-profile-vlan-5)# translate old-vlan 2 2 new-vlan 10 5
Device(deploy-profile-vlan-5)# active
```

| <b>Related Commands</b> | <b>Command</b>        | <b>Description</b>                |
|-------------------------|-----------------------|-----------------------------------|
|                         | <b>deploy profile</b> | Deploys a profile type            |
|                         | <b>aim</b>            | Creates aim based on the profile. |

**type 1 fix**

# type 1 fix

To configure only a fixed bandwidth, use the **type 1 fix *fixed\_bandwidth*** command in DBA profile configuration mode.

**type 1 fix *fixed\_bandwidth***

|                           |  |  |
|---------------------------|--|--|
| <b>Syntax Description</b> | <i>fixed_bandwidth</i>   | The fixed bandwidth in kbps. The range is from 0 to 1024000. The fixed bandwidth must be divisible by 64 kbps. |
| <b>Command Modes</b>      | DBA profile configuration (deploy-profile-dba)   |  |
| <b>Usage Guidelines</b>   | Type 1 T-CONT is preferred for services that are sensitive to the data forwarding delay. For example, VoIP services.<br><br>A DBA profile type must be configured.<br><br>Modifying and activating the DBA profile will cause the ONT that references the template to go online again. |  |

## Examples

This example shows how to configure type 1 T-CONT.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile dba
Device(deploy-profile-dba)# aim 5
Device(deploy-profile-dba-5)# type 1 fix 1024
Device(deploy-profile-dba-5)# active
```

| Command               | Description                       |
|-----------------------|-----------------------------------|
| <b>deploy profile</b> | Deploys a profile type            |
| <b>aim</b>            | Creates aim based on the profile. |

# type 2

To configure only the assured bandwidth, use the **type 2 assured assured\_bandwidth** command in DBA profile configuration mode.

## **type 2 assured assured\_bandwidth**

| <b>Syntax Description</b> | <i>assured_bandwidth</i>  | The assured bandwidth in kbps. The range is 0 to 1024. The assured bandwidth must be divisible by 64.  |         |             |                       |                        |            |                                   |
|---------------------------|---|--|---------|-------------|-----------------------|------------------------|------------|-----------------------------------|
| <b>Command Modes</b>      | DBA profile configuration (deploy-profile-dba)  |  |         |             |                       |                        |            |                                   |
| <b>Usage Guidelines</b>   | Type 2 T-CONT is preferred for services without strict delay and jitter requirements. For example, IPTV multicast services.<br><br>A DBA profile type must be configured.<br><br>Modifying and activating the DBA profile will cause the ONT that references the template to go online again. |  |         |             |                       |                        |            |                                   |
| <b>Examples</b>           | This example shows how to configure type 2 T-CONT.  | <pre>Device&gt; enable Device# configure terminal Device(config)# deploy profile dba Device(deploy-profile-dba)# aim 5 Device(deploy-profile-dba-5)# type 2 assured 1024 Device(deploy-profile-dba-5)# active</pre>  |         |             |                       |                        |            |                                   |
|                           |   | <table border="1"> <thead> <tr> <th>Command</th><th>Description</th></tr> </thead> <tbody> <tr> <td><b>deploy profile</b></td><td>Deploys a profile type</td></tr> <tr> <td><b>aim</b></td><td>Creates aim based on the profile.</td></tr> </tbody> </table> | Command | Description | <b>deploy profile</b> | Deploys a profile type | <b>aim</b> | Creates aim based on the profile. |
| Command                   | Description   |  |         |             |                       |                        |            |                                   |
| <b>deploy profile</b>     | Deploys a profile type  |  |         |             |                       |                        |            |                                   |
| <b>aim</b>                | Creates aim based on the profile.   |  |         |             |                       |                        |            |                                   |

# type 3

To configure both assured bandwidth and non-assured bandwidth, use the **type 3 assured assured\_bandwidth max max\_bandwidth** command in DBA profile configuration mode.

**type 3 assured assured\_bandwidth max max\_bandwidth**

|                           |                          |   |
|---------------------------|--------------------------|---|
| <b>Syntax Description</b> | <i>assured_bandwidth</i> | The assured bandwidth in kbps. The range is |
|                           |                          | The assured bandwidth must be divisible by  |
|                           | <i>max_bandwidth</i>     | The maximum bandwidth in kbps. The range    |
|                           |                          | The maximum bandwidth must be divisible by  |

|                      |  |
|----------------------|--|
| <b>Command Modes</b> | DBA profile configuration (deploy-profile-dba) |
|----------------------|--|

|                         |   |
|-------------------------|---|
| <b>Usage Guidelines</b> | Type 3 T-CONT is preferred for services with variable-rate burst traffic.<br>A DBA profile type must be configured.<br>Modifying and activating the DBA profile will cause the ONT that references the template to go online again. |
|-------------------------|---|

|                 |  |
|-----------------|--|
| <b>Examples</b> | This example show how to configure both assured bandwidth and non-assured bandwidth. |
|-----------------|--|

```
Device> enable
Device# configure terminal
Device(config)# deploy profile dba
Device(deploy-profile-dba)# aim 5
Device(deploy-profile-dba-5)# type 3 assured 1024 max 2500
Device(deploy-profile-dba-5)# active
```

| Command               | Description                       |
|-----------------------|-----------------------------------|
| <b>deploy profile</b> | Deploys a profile type            |
| <b>aim</b>            | Creates aim based on the profile. |

# type 4

To configure the optimum bandwidth, use the **type 4 max max\_bandwidth** command in DBA profile configuration mode.

## **type 4 max max\_bandwidth**

| <b>Syntax Description</b> | <i>max_bandwidth</i>  | The maximum bandwidth in kbps. The range is 0 to 1024000. The maximum bandwidth must be divisible by 128.  |         |             |                       |                        |            |                                   |
|---------------------------|---|--|---------|-------------|-----------------------|------------------------|------------|-----------------------------------|
| <b>Command Modes</b>      | DBA profile configuration (deploy-profile-dba)  |  |         |             |                       |                        |            |                                   |
| <b>Usage Guidelines</b>   | Type 4 T-CONT is preferred for services with variable-rate burst traffic which does not exhibit delay sensitivity. For example, internet data services.<br><br>A DBA profile type must be configured.<br><br>Modifying and activating the DBA profile will cause the ONT that references the template to go online again. |  |         |             |                       |                        |            |                                   |
| <b>Examples</b>           | This example show how to configure the optimum bandwidth.   | <pre>Device&gt; enable Device# configure terminal Device(config)# deploy profile dba Device(deploy-profile-dba)# aim 5 Device(deploy-profile-dba-5)# type 4 max 1024 Device(deploy-profile-dba-5)# active</pre>  |         |             |                       |                        |            |                                   |
|                           |   | <table border="1"> <thead> <tr> <th>Command</th><th>Description</th></tr> </thead> <tbody> <tr> <td><b>deploy profile</b></td><td>Deploys a profile type</td></tr> <tr> <td><b>aim</b></td><td>Creates aim based on the profile.</td></tr> </tbody> </table> | Command | Description | <b>deploy profile</b> | Deploys a profile type | <b>aim</b> | Creates aim based on the profile. |
| Command                   | Description   |  |         |             |                       |                        |            |                                   |
| <b>deploy profile</b>     | Deploys a profile type  |  |         |             |                       |                        |            |                                   |
| <b>aim</b>                | Creates aim based on the profile.   |  |         |             |                       |                        |            |                                   |

# type 5

To configure a combination of fixed, assured and best-effort bandwidth, use the **type 5 fix *fixed\_bandwidth* assured *assured\_bandwidth* max *max\_bandwidth*** command in DBA profile configuration mode.

**type 5 fix *fixed\_bandwidth* assured *assured\_bandwidth* max *max\_bandwidth***

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <p><i>fixed_bandwidth</i></p> <p>The fixed bandwidth in kbps. The range is 0 to 2048. The fixed bandwidth must be divisible by 128.</p>  |
|                           | <p><i>assured_bandwidth</i></p> <p>The assured bandwidth in kbps. The range is 0 to 2048. The assured bandwidth must be divisible by 128.</p>  |
|                           | <p><i>max_bandwidth</i></p> <p>The maximum bandwidth in kbps. The range is 0 to 2048. The maximum bandwidth must be divisible by 128.</p>  |
| <b>Command Modes</b>      | DBA profile configuration (deploy-profile-dba)   |
| <b>Usage Guidelines</b>   | <p>Type 5 T-CONT is preferred for services with general traffic.</p> <p>A DBA profile type must be configured.</p> <p>Modifying and activating the DBA profile will cause the ONT that references the template to go online again.</p> |

## Examples

This example show how to configure a combination of fixed, assured and best-effort bandwidth

```
Device> enable
Device# configure terminal
Device(config)# deploy profile dba
Device(deploy-profile-dba)# aim 5
Device(deploy-profile-dba-5)# type 5 fix 1024 assured 1024 max 2048
Device(deploy-profile-dba-5)# active
```

| Command               | Description                       |
|-----------------------|-----------------------------------|
| <b>deploy profile</b> | Deploys a profile type            |
| <b>aim</b>            | Creates aim based on the profile. |

# upload keyfile

To upload the local key to the key server, use the **upload keyfile** command in privileged EXEC mode.

## Upload to a TFTP server

```
upload keyfile {public | private} tftp {inet | inet6} server_ip filename
```

## Upload to a FTP server

```
upload keyfile {public | private} ftp {inet | inet6}server_ip filename
```

| Syntax Description | public  | The public SSH key file              |         |             |     |                        |              |  |
|--------------------|---|--------------------------------------|---------|-------------|-----|------------------------|--------------|--|
|                    | private   | The private SSH key file             |         |             |     |                        |              |  |
|                    | tftp  | Loads the file from the TFTP server. |         |             |     |                        |              |  |

## us car

To configures GEM port traffic control, use the **us car cir cbs cbs pir pir pbs pbs** command in uplink traffic profile configuration mode.

**us car cir cbs cbs pir pir pbs pbs**

| <b>Syntax Description</b> | <b>cir cir</b><br>The committed information rate in kbps.<br>The range is from 64 to 800000.  |         |             |                       |                        |            |                                   |
|---------------------------|---|---------|-------------|-----------------------|------------------------|------------|-----------------------------------|
|                           | <b>cbs cbs</b><br>The committed burst size in KB.<br>The range is from 2 to 25000.  |         |             |                       |                        |            |                                   |
|                           | <b>pir pir</b><br>The peak information rate in kbps.<br>The range is from 64 to 1024000.  |         |             |                       |                        |            |                                   |
|                           | <b>pbs pbs</b><br>The peak burst size in KB.<br>The range is from 2 to 25000.   |         |             |                       |                        |            |                                   |
| <b>Command Modes</b>      | Uplink traffic profile (deploy-profile-us-traffic)  |         |             |                       |                        |            |                                   |
| <b>Usage Guidelines</b>   | An uplink profile type must be configured.<br>The peak information rate requirement is greater than or equal to committed information rate.<br>Modifying and activating the uplink traffic profile will cause the ONT that references the template to go online again.  |         |             |                       |                        |            |                                   |
| <b>Examples</b>           | This example shows how to configures GEM port traffic control. <pre>Device&gt; enable Device# configure terminal Device(config)# deploy profile us-traffic Device(deploy-profile-us-traffic)# aim 5 Device(deploy-profile-us-traffic-5)# us queue 1 Device(deploy-profile-us-traffic-5)# us car cir 128 cbs 1024 pir 128 pbs 24 Device(deploy-profile-us-traffic-5)# active</pre> |         |             |                       |                        |            |                                   |
| <b>Related Commands</b>   | <table border="1"> <thead> <tr> <th>Command</th><th>Description</th></tr> </thead> <tbody> <tr> <td><b>deploy profile</b></td><td>Deploys a profile type</td></tr> <tr> <td><b>aim</b></td><td>Creates aim based on the profile.</td></tr> </tbody> </table>  | Command | Description | <b>deploy profile</b> | Deploys a profile type | <b>aim</b> | Creates aim based on the profile. |
| Command                   | Description   |         |             |                       |                        |            |                                   |
| <b>deploy profile</b>     | Deploys a profile type  |         |             |                       |                        |            |                                   |
| <b>aim</b>                | Creates aim based on the profile.   |         |             |                       |                        |            |                                   |

# us queue

To configure GEM port queue priority, use the **us queue** command in uplink traffic profile configuration mode.

**us queue *priority\_queue***

| <b>Syntax Description</b> | <i>priority_queue</i>  | The priority queue.<br>The range is from 0 to 7. |         |             |                       |                        |            |                                   |
|---------------------------|--|--|---------|-------------|-----------------------|------------------------|------------|-----------------------------------|
| <b>Command Modes</b>      | Uplink traffic profile (deploy-profile-us-traffic)   |  |         |             |                       |                        |            |                                   |
| <b>Usage Guidelines</b>   | An uplink profile type must be configured.   |  |         |             |                       |                        |            |                                   |

## aaa

To enter Authentication Authorization and Accounting (AAA) configuration mode, use the **aaa** command in global configuration mode.

**aaa**

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | This example shows how to enter AAA configuration mode. |
|-----------------|---|

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)#

```

| <b>Related Commands</b> | <b>Command</b>                   | <b>Description</b>                     |
|-------------------------|----------------------------------|--|
|                         | <b>auth-secret-key</b>           | Configures a RADIUS authentication key |
|                         | <b>default domain-name</b>       | Enables or disables the default domain |
|                         | <b>domain <i>domain_name</i></b> | Specifies a RADIUS domain name         |

# auth-secret-key

To configure a RADIUS authentication key, use the **auth-secret-key** command in AAA configuration mode. To delete the configured RADIUS authentication key, use the **no** form of the command.

**auth-secret-key** *key*  
**no auth-secret-key**

| <b>Syntax Description</b> | <i>key</i><br>The secret key.  |         |             |            |                               |
|---------------------------|--|---------|-------------|------------|-------------------------------|
| <b>Command Modes</b>      | AAA configuration (config-aaa)   |         |             |            |                               |
| <b>Usage Guidelines</b>   | Use this command in the AAA configuration mode.  |         |             |            |                               |
| <b>Examples</b>           | This example shows how to configure a RADIUS authentication key<br><br><pre>Device&gt; enable Device# configure terminal Device(config)# aaa Device(config-aaa)# radius host radius1 Device(config-aaa-radius-radius1)# auth-secret-key key1</pre> |         |             |            |                               |
| <b>Related Commands</b>   | <table border="1"> <thead> <tr> <th>Command</th><th>Description</th></tr> </thead> <tbody> <tr> <td><b>aaa</b></td><td>Enters AAA configuration mode</td></tr> </tbody> </table>   | Command | Description | <b>aaa</b> | Enters AAA configuration mode |
| Command                   | Description  |         |             |            |                               |
| <b>aaa</b>                | Enters AAA configuration mode  |         |             |            |                               |

# default domain-name

To enable or disable the default domain, use the **default domain-name** command in AAA configuration mode.

**default domain-name {enable domain-name | disable}**

|                           |   |   |
|---------------------------|---|---|
| <b>Syntax Description</b> | <b>enable</b><br><i>domain-name</i><br><b>disable</b> | Enables the default domain.<br>The default domain name<br>The format is string.<br>Disables the default domain. |
|---------------------------|---|---|

**Command Modes** AAA configuration (config-aaa)

**Usage Guidelines** Use this command in the AAA configuration mode.

**Examples** This example shows how to configure the default domain.

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# domain default1
Device(config-aaa-domain-default1)# radius host binding cisco
Device(config-aaa-domain-default1)# state active
Device(config-aaa-domain-default1)# exit
Device(config-aaa)# default domain-name enable domain1
Succeed in setting default domain.
```

| Related Commands | Command    | Description                   |
|------------------|------------|-------------------------------|
|                  | <b>aaa</b> | Enters AAA configuration mode |

# domain

To specify a RADIUS domain name, use the **domain *domain\_name*** command in AAA configuration mode.

**domain *domain\_name***

|                           |                    |  |
|---------------------------|--------------------|--|
| <b>Syntax Description</b> | <i>domain_name</i> | The name of the domain.<br>The format is string. |
|---------------------------|--------------------|--|

|----------------------|--------------------------------|
| <b>Command Modes</b> | AAA configuration (config-aaa) |
|----------------------|--------------------------------|

|                         |   |
|-------------------------|---|
| <b>Usage Guidelines</b> | Use this command in the AAA configuration mode. |
|-------------------------|---|

|                 |  |
|-----------------|--|
| <b>Examples</b> | This example shows how to specify the RADIUS domain name |
|-----------------|--|

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# domain domain1
Device(config-aaa-domain-domain1)#

```

## Related Commands

| Command    | Description                   |
|------------|-------------------------------|
| <b>aaa</b> | Enters AAA configuration mode |

# login-access-list

To allow access for specific IP addresses, use the **login-access-list {snmp | ssh | telnet}** command in global configuration mode. To block all IP addresses, use the **no login-access-list** command.

**login-access-list {snmp ip\_address mask | ssh ip\_address mask | telnet ip\_address mask | telnet-limit max\_user\_number}**

**no login-access-list {snmp {all | ip\_address mask} | ssh {all | ip\_address mask} | telnet {all | ip\_address mask} | telnet-limit max\_user\_number}**

| Syntax Description                  |  |                           |
|-------------------------------------|--|---------------------------|
| <b>snmp</b>                         |  | The SNMP client           |
| <b>ssh</b>                          |  | The SSH client            |
| <b>telnet</b>                       |  | The Telnet client         |
| <b>all</b>                          |  | Deletes all IP addresses  |
| <i>ip_address</i>                   |  | The IP address            |
| <i>mask</i>                         |  | The IP address mask       |
| <b>telnet-limit max_user_number</b> |  | Limit the number of users |
|                                     |  | The range is 1 to 1000    |

**Command Modes** Global configuration (config)

**Usage Guidelines** Use the **no login-access-list {snmp| ssh |telnet} all** command to block all IP access.

Use the **login-access-list {snmp| ssh |telnet} 0.0.0.0 [ 0.0.0.0 | 255.255.255.255]** command to allow all IP access.

**Examples** This example shows how to delete all IP addresses from the SNMP client.

```
Device> enable
Device# configure terminal
Device(config)# no login-access-list snmp all
Delete access ip address successfully.
```

| Related Commands | Command                       | Description                                |
|------------------|-------------------------------|--|
|                  | <b>show login-access-list</b> | Displays the list of allowed IP addresses. |

# muser local

To enable local authentication mode, use the **muser local** command in global configuration mode.

## muser local

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

## Examples

This example shows how to enable local authentication mode

```
Device> enable
Device# configure terminal
Device(config)# muser local
Config manager user authentication successfully.
```

## Related Commands

| Command           | Description                               |
|-------------------|---|
| <b>show muser</b> | Displays the authentication configuration |

# muser radius

To enable RADIUS remote authentication, use the **muser radius *radius\_name*** command in global configuration mode.

**muser radius *radius\_name* {pap | chap} {account | local}**

|                           |                    |  |
|---------------------------|--------------------|--|
| <b>Syntax Description</b> | <i>radius_name</i> | The RADIUS host name.<br>The format is string. The range is from 1 to 32 characters. |
|                           | <b>pap</b>         | The password authentication protocol (PAP)   |
|                           | <b>chap</b>        | The challenge handshake authentication protocol (CHAP)                               |
|                           | <b>account</b>     | Manages login accounting through the RADIUS server.                                  |
|                           | <b>local</b>       | Allows local authentication when the remote authentication fails.                    |

**Command Modes** Global configuration (config)

## Examples

This example shows how to enable RADIUS remote authentication.

```
Device> enable
Device# configure terminal
Device(config)# muser radius cisco pap local
```

| <b>Related Commands</b> | <b>Command</b>    | <b>Description</b>                        |

| <b>aaa</b>                | Enters AAA configuration mode  |  |         |             |            |                               |                         |  |
| <b>show radius host</b>   | Displays the RADIUS host configuration   |  |         |             |            |                               |                         |  |

# service password-encryption

To save a password in cipher text, use the **service password-encryption** command in global configuration mode.

## service password-encryption

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

|                 |  |
|-----------------|--|
| <b>Examples</b> | This example shows how to save a password in cipher text |
|-----------------|--|

```
Device> enable
Device# configure terminal
Device(config)# service password-encryption
```

**show domain**

# show domain

To display the domain configuration, use the **show domain** command in privileged EXEC or global configuration mode.

**show domain [domain\_name]**

|                           |  |  |
|---------------------------|--|--|
| <b>Syntax Description</b> | <i>domain_name</i>                                   | The name of the domain.<br>The format is string. |
| <b>Command Modes</b>      | Privileged EXEC (#)<br>Global configuration (config) |  |

## Examples

This example shows how to display the domain configuration.

```
Device> enable
Device# configure terminal
Device(config)# show domain domain1
Default domain name : domain1
DomainName       : domain1
RADIUSServerName : cisco
Access-limit     : disabled
AccessedNum      : 0
Scheme          : radius
State           : Block
-----
Total [1] item(s).
```

# show login-access-list

To display the list of allowed IP addresses, use the **show login-access-list** command in privileged EXEC or global configuration mode.

## show login-access-list

**Command Modes** Privileged EXEC (#)

Global configuration (config)

**Examples** This example shows how to view the list of allowed IP addresses.

```
Device> enable
Device# configure terminal
Device(config)# show login-access-list
sno  ipAddress    wildcard bits    terminal
1    0.0.0.0      255.255.255.255  telnet
2    0.0.0.0      255.255.255.255  ssh
```

**Related Commands**

| Command  | Description                             |
|--|---|
| <b>login-access-list {snmp   ssh   telnet}</b> | Allows access for specific IP addresses |

**show muser**

## show muser

To display the authentication configuration, use the **show muser** command in privileged EXEC or global configuration mode.

**show muser**

---

**Command Modes** Privileged EXEC (#)

Global configuration (config)

---

**Examples** This example shows how to view the authentication configuration.

```
Device> enable
Device# configure terminal
Device(config)# show muser
Show manager user authentication.
Authentication type : local
Admin-Remote-Auth: Disable
```

# show running-config oam

To display the timeout configuration, use the **show running-config oam** command in privileged EXEC or global configuration mode.

## show running-config oam

**Command Modes** Privileged EXEC (#)

Global configuration (config)

**Examples** This example shows how to view the timeout configuration.

```
Device> enable
Device# configure terminal
Device(config)# show running-config oam
! [OAM]
no login-access-list snmp 0.0.0.0 255.255.255.255
service password-encryption
username text privilege 0 password 7 884863d2
banner
screen-rows per-page 55
hostname 2
telnet limit 3
exit
timeout 100
configure terminal
telnetclient timeout 2
ip icmp mask-reply
```

```
show tacacs+
```

## show tacacs+

To display the TACACS+ configuration, use the **show tacacs+** command in privileged EXEC or global configuration mode.

**show tacacs+**

**Command Modes** Privileged EXEC (#)

Global configuration (config)

### Examples

This example shows how to view the TACACS+ configuration.

```
Device> enable
Device# configure terminal
Device(config)# show tacacs+
Primary Server Configurations:
IP address: : 192.168.1.10
Connection port: : 49
Connection timeout: : 5
Key: : 123456

Secondary Server Configurations:
IP address: : 192.168.1.11
Connection port: : 49
Connection timeout: : 5
Key: : 123456
```

# show username

To display the user information, use the **show username** command in privileged EXEC or global configuration mode.

**show username *username***

| <b>Syntax Description</b>   | <i>username</i>                                      | The user name.                |         |             |                                 |             |
|---|--|-------------------------------|---------|-------------|---------------------------------|-------------|
| <b>Command Modes</b>  | Privileged EXEC (#)                                  | Global configuration (config) |         |             |                                 |             |
| <b>Examples</b>   | This example shows how to view the user information. |                               |         |             |                                 |             |
| <pre>Device&gt; enable Device# configure terminal Device(config)# show username admin display user information Terminal type: C=Console, T=Telnet, S=SSH, W=Web Global Failmax: n/a User Name          Role      Terminal   FailMax   Fail       OnLineMax  OnLine admin             ADMIN     CTSW       n/a        0         n/a        1</pre> |  |                               |         |             |                                 |             |
| <b>Related Commands</b> <table border="1"> <thead> <tr> <th>Command</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><b>username <i>username</i></b></td> <td>Adds a user</td> </tr> </tbody> </table>   |  |                               | Command | Description | <b>username <i>username</i></b> | Adds a user |
| Command   | Description  |                               |         |             |                                 |             |
| <b>username <i>username</i></b>   | Adds a user  |                               |         |             |                                 |             |

**show username privilege-auth**

## show username privilege-auth

To display the privilege password authentication configuration, use the **show username privilege-auth** command in privileged EXEC or global configuration mode.

**show username privilege-auth**

**Command Modes** Privileged EXEC (#)

Global configuration (config)

### Examples

This example shows how to view the configuration of second-tier password authentication

```
Device> enable
Device# configure terminal
Device(config)# show username privilege-auth
Privilege-password authentication
switch: OFF
remote-user name: remote_admin
password not configured
```

### Related Commands

| Command                        | Description  |
|--------------------------------|--|
| <b>username privilege-auth</b> | Enables privilege password authentication for a local user |

# show username silent

To display a user silent period information, use the **show username silent** command in privileged EXEC or global configuration mode.

## show username silent

**Command Modes** Privileged EXEC (#)

Global configuration (config)

**Examples** This example shows how to view a user silent period information

```
Device> enable
Device# configure terminal
Device(config)# show username silent
display user silent period information
Silent Time: 2 minutes
User Name          State      Silent End Time
-----
admin              Off       n/a
text               Off       n/a
```

## Related Commands

| Command                         | Description                   |
|---------------------------------|-------------------------------|
| <b>username <i>username</i></b> | Adds a user                   |
| <b>username silent-time</b>     | Configures the silent time    |
| <b>show username</b>            | Displays the user information |

**show users**

# show users

To display the online users, use the **show users** command in privileged EXEC or global configuration mode.

## show users

**Command Modes** Privileged EXEC (#)

Global configuration (config)

## Examples

This example shows how to view the online users.

```
Device> enable
Device# configure terminal
Device(config)# show users
Only 5 users logged in by telnet are allowed to be in privileged mode.
Now 1 users logged in by telnet have been in privileged mode.

User "admin" logged in at time 2001/12/09 16:53:44
Time passed after login: 0 days 0 hours 12 minutes 32 seconds
Time no operation: 0 minutes 0 seconds
Terminal: telnet 1
Transport: telnet
User's IP address: 10.65.75.54
Authentication: local
Radius hostname: N/A
```

# state active

To activate a domain, use the **state active** command in AAA configuration mode.

## state active

|                      |                                |
|----------------------|--------------------------------|
| <b>Command Modes</b> | AAA configuration (config-aaa) |
|----------------------|--------------------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | This example shows to activate a configured domain. |
|-----------------|---|

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# domain default1
Device(config-aaa-domain-default1)# radius host binding cisco
Device(config-aaa-domain-default1)# state active
Device(config-aaa-domain-default1)# exit
```

## Related Commands

| Command            | Description          |
|--------------------|----------------------|
| <b>state block</b> | Deactivates a domain |

**state block**

# state block

To deactivate a domain, use the **state block** command in AAA configuration mode.

**state block**

|                      |                        |
|----------------------|------------------------|
| <b>Command Modes</b> | AAA configuration mode |
|----------------------|------------------------|

**Examples**

This example shows how to deactivate a domain.

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# domain default1
Device(config-aaa-domain-default1)# state block
```

**Related Commands**

| Command             | Description        |
|---------------------|--------------------|
| <b>state active</b> | Activates a domain |

# stop

To force user or users to go offline, use the **stop** command in privileged EXEC mode.

```
stop {username | vty {all vty_list} | telnet {all terminal_id}}
```

## Syntax Description

|                    |  |
|--------------------|--|
| <i>username</i>    | The username                                 |
| <b>all</b>         | Stops all.                                   |
| <i>vty_list</i>    | The VTY list.                                |
| <i>terminal_id</i> | The terminal ID<br>The range is from 0 to 5. |

## Command Modes

Privileged EXEC (#)

## Examples

This example shows how to force a user offline

```
Device> enable
Device# stop Jerry
```

# tacacs+

To configure the TACACS + server, use the **tacacs+** command in global configuration mode.

**tacacs+ {primary | secondary}server *ip\_address* [**encrypt-key** *value* | **key** *key* | **port** *port* | **timeout** *value*]**

|                                 |  |  |
|---------------------------------|--|--|
| <b>Syntax Description</b>       |  |  |
| <b>primary</b>                  |  | Configures the primary server.   |
| <b>secondary</b>                |  | Configures the secondary server.   |
| <b>server <i>ip_address</i></b> |  | The server IP address.   |
| <b>encrypt-key <i>value</i></b> |  | The server key encryption.   |
| <b>key <i>key</i></b>           |  | The server key configuration.  |
| <b>port<i>port</i></b>          |  | The TCP port.<br>The range is from 1 to 65535.                                 |
| <b>timeout <i>value</i></b>     |  | The connection timeout.<br>The range is from 1 to 70. The default value is 10. |

**Command Modes** Global configuration (config)

## Examples

This example shows how to configure the TACACS + primary server

```
Device> enable
Device# configure terminal
Device(config)# tacacs+ primary server 192.168.1.10 key 123456
```

## Related Commands

| Command             | Description                        |
|---------------------|------------------------------------|
| <b>show tacacs+</b> | Displays the TACACS+ configuration |

# tacacs+ authentication-type

To configure an authentication type, use the **tacacs+ authentication-type** command in global configuration mode.

**tacacs+ authentication-type {ascii | chap | pap}**

|                           |       |  |
|---------------------------|-------|--|
| <b>Syntax Description</b> | ascii | Configures the ASCII authentication type.  |
|                           | chap  | Configures the Challenge Handshake Authentication Protocol (CHAP) authentication type. |
|                           | pap   | Configures the Password Authentication Protocol (PAP) authentication type.             |

**Command Modes** Global configuration (config)

**Examples** This example shows how to configure an ASCII authentication type

```
Device> enable
Device# configure terminal
Device(config)# tacacs+ authentication-type ascii
```

| Related Commands | Command             | Description                        |
|------------------|---------------------|------------------------------------|
|                  | <b>show tacacs+</b> | Displays the TACACS+ configuration |

**tacacs+ encrypt-key**

## tacacs+ encrypt-key

To enable password encryption, use the **tacacs+ encrypt-key** command in global configuration mode. To disable password encryption, use the **no tacacs+ encrypt-key** command.

**tacacs+ encrypt-key**

**no tacacs+ encrypt-key**

**Command Modes** Global configuration (config)

**Examples** This example shows how to enable password encryption

```
Device> enable
Device# configure terminal
Device(config)# tacacs+ encrypt-key
```

**Related Commands**

| Command             | Description                        |
|---------------------|------------------------------------|
| <b>show tacacs+</b> | Displays the TACACS+ configuration |

# tacacs+ preemption-time

To configure the recovery time to switch to the TACACS+ primary server, use the **tacacs+ preemption-time** command in global configuration mode.

**tacacs+ preemption-time *time***

|                           |             |   |
|---------------------------|-------------|---|
| <b>Syntax Description</b> | <i>time</i> | The preemption time<br>The unit in minutes.<br>The range is from 0 to 1440. The default value is c0 |
|---------------------------|-------------|---|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

## Examples

This example shows how to configure the recovery time to switch to the TACACS+ primary server.

```
Device> enable
Device# configure terminal
Device(config)# tacacs+ preemption-time 200
```

| <b>Related Commands</b> | <b>Command</b>      | <b>Description</b>                 |
|-------------------------|---------------------|------------------------------------|
|                         | <b>show tacacs+</b> | Displays the TACACS+ configuration |

**timeout**

# timeout

To configure the system idle timeout, use the **timeout** command in privileged Exec mode. To disable the system idle timeout, use the **no timeout** command.

**timeout** *value*

**no timeout**

|                           |              |   |
|---------------------------|--------------|---|
| <b>Syntax Description</b> | <i>value</i> | The system idle timeout value.<br>The range is 1-480. The default timeout value is 20m. |
|---------------------------|--------------|---|

|                      |                     |
|----------------------|---------------------|
| <b>Command Modes</b> | Privileged Exec (#) |
|----------------------|---------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | This example shows how to configure the system idle timeout |
|-----------------|---|

```
Device> enable
Device# timeout 100
The idle time is : 100 minutes!
```

# username

To add a user or modify an existing user privilege level, use the **username *username*** command in global configuration mode. To remove a user, use the **no username *username*** command.

```
username username {password {0 | 7}password | privilege privilege_level password {0 | 7}password | terminal {all | console | none | ssh | telnet | web}}
```

**no username *username***

## Syntax Description

|                        |   |
|------------------------|---|
| <i>username</i>        | The username.   |
| <b>password 0  7</b>   | <p>The password encryption time.</p> <ul style="list-style-type: none"> <li>• A value of 0 means the password is encrypted using the MD5 algorithm.</li> <li>• A value of 7 means the password is encrypted using the SHA-256 algorithm.</li> </ul> |
| <i>password</i>        | The password.   |
| <i>privilege_level</i> | <p>The privilege level.</p> <ul style="list-style-type: none"> <li>• A privilege value of 0 or 1.</li> <li>• A privilege value between 1 and 15.</li> <li>• Super user (admin) requires privilege level 15.</li> </ul>                              |
| <b>terminal</b>        | <p>The login mode</p> <p>The options are</p> <ul style="list-style-type: none"> <li>• console</li> <li>• none</li> <li>• SSH</li> <li>• Telnet</li> <li>• Web</li> </ul>  |

## Command Modes

Global configuration (config)

## Usage Guidelines

If you do not enter a permission value when you create a user, the system will automatically assign it with normal permissions.

Configure the password encryption type as 0 for a new user. When you configure the **service password-encryption** command, a password configured in plain text (0) is decrypted in de-compilation and the decrypted password type changes to 7.

## Examples

This example shows how to add a new user.

**username**

```
Device> enable
Device# configure terminal
Device(config)# username mark privilege 0 password 0 mark@123
Add user successfully.
```

**Related Commands**

| <b>Command</b>                       | <b>Description</b>  |
|--------------------------------------|---|
| <b>show username</b>                 | Displays the user information                               |

|                  | <b>show username</b>            | Displays the user information |

**username change-privilege-pwd**

## username change-privilege-pwd

To configure the second-tier password authentication, use the **username change-privilege-pwd** command in global configuration mode.

**username change-privilege-pwd {0 | 7}**

|                           |  |  |
|---------------------------|--|--|
| <b>Syntax Description</b> | { 0   7}   | <ul style="list-style-type: none"> <li>• A value of 0 means the password is required.</li> <li>• A value of 7 means the password is optional.</li> </ul> |
| <b>Command Modes</b>      | Global configuration (config)  |  |
| <b>Examples</b>           | This example shows how to configure the second-tier password authentication. |  |

```
Device> enable
Device# configure terminal
Device(config)# username change-privilege-pwd 0 123456
```

| Related Commands | Command                         | Description                   |

|                  | <b>username <i>username</i></b> | Adds a user                   |
|                  | <b>show username</b>            | Displays the user information |

# username failmax

To configure a limit on the consecutive failed login attempts, use the **username failmax** command in global configuration mode. To disable the limit on the consecutive failed login attempts, use the **no username failmax** command.

**username failmax {fail\_value | username fail\_value}**

**no username failmax**

|                           |                                      |   |
|---------------------------|--------------------------------------|---|
| <b>Syntax Description</b> | <i>fail_value</i><br><i>username</i> | The fail value.<br>The range is from 1 to 100.<br>The username. |
|---------------------------|--------------------------------------|---|

**Command Modes** Global configuration (config)

## Examples

This example shows how to configure a limit on the consecutive failed login attempts.

```
Device> enable
Device# configure terminal
Device(config)# username failmax 5
```

| Related Commands | Command                         | Description                   |

| <b>show username</b>            | Displays the user information  |         |             |                                 |             |                      |                               |

# username privilege-auth-remote-user

To enable privilege password authentication for a remote user, use the **username privilege-auth-remote-user** command in global configuration mode. To disable user privilege password authentication, use the **no username privilege-auth** command.

**username privilege-auth-remote-user *username***

**no username privilege-auth-remote-user**

| Syntax Description | <i>username</i> | The username. |
|--------------------|-----------------|---------------|
|--------------------|-----------------|---------------|

|               |                               |
|---------------|-------------------------------|
| Command Modes | Global configuration (config) |
|---------------|-------------------------------|

## Examples

This example shows how to enable privilege password authentication.

```
Device> enable
Device# configure terminal
Device(config)# username privilege-auth-remote-user mark
Enable Privilege-password authentication OK!
```

| Related Commands | Command              | Description                   |
|------------------|----------------------|-------------------------------|
|                  | <b>show username</b> | Displays the user information |

| Related Commands | Command                         | Description                   |
|------------------|---------------------------------|-------------------------------|
|                  | <b>username <i>username</i></b> | Adds a user                   |
|                  | <b>show username</b>            | Displays the user information |

**username privilege-auth**

## username privilege-auth

To enable privilege password authentication for a user, use the **username privilege-auth** command in global configuration mode. To disable user privilege password authentication, use the **no username privilege-auth** command.

**username privilege-auth [always]**

**no username privilege-auth**

|                           |               |   |
|---------------------------|---------------|---|
| <b>Syntax Description</b> | <b>always</b> | Configures privilege password authentication for all users. |
|---------------------------|---------------|---|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

|                 |  |
|-----------------|--|
| <b>Examples</b> | This example shows how to enable user privilege password authentication. |
|-----------------|--|

```
Device> enable

**channel-group group\_id**

## channel-group group\_id

To configure the aggregation group ID, use the **channel-group channel\_group\_id** command in global configuration mode. To disable the aggregation group ID, use the **no channel-group channel\_group\_id** command.

**channel-group channel\_group\_id**

**no channel-group channel\_group\_id**

|                           |                         |  |
|---------------------------|-------------------------|--|
| <b>Syntax Description</b> | <i>channel_group_id</i> | The channel group ID.<br>The range is 0-5. |
|---------------------------|-------------------------|--|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

### Examples

This example shows how to configure the aggregation group ID

```
Device> enable
Device# configure terminal
Device(config)# channel-group 4
```

# channel-group load-balance

To configure a load balance policy, use the **channel-group load-balance** command in global configuration mode. To disable a load balance policy, use the **no channel-group load-balance** form of this command.

**channel-group load-balance {dst-ip | dst-mac | src-dst-ip | src-dst-mac | src-ip | src-mac}**

**no channel-group load-balance**

| Syntax Description |                    |   |
|--------------------|--------------------|---|
|                    | <b>dst-ip</b>      | Configures the load balance policy based on destination IP address.             |
|                    | <b>dst-mac</b>     | Configures the load balance policy based on destination MAC address.            |
|                    | <b>src-dst-ip</b>  | Configures the load balance policy based on source and destination IP address.  |
|                    | <b>src-dst-mac</b> | Configures the load balance policy based on source and destination MAC address. |
|                    | <b>src-ip</b>      | Configures the load balance policy based on source IP address.                  |
|                    | <b>src-mac</b>     | Configures the load balance policy based on source MAC address.                 |

**Command Modes** Global configuration (config)

**Examples** This example shows how to configure a load balance policy based on source MAC.

```
Device> enable
Device# configure terminal
Device(config)# channel-group load-balance src-mac
```

**channel-group group\_id mode**

## channel-group group\_id mode

To add a port to an aggregation group, use the **channel-group channel\_group\_id mode** command in interface configuration mode. To disable the aggregation group ID, use the **no channel-group channel\_group\_id mode** command.

**channel-group channel\_group\_id mode {on | active | passive}**

**no channel-group channel\_group\_id mode**

|                           |                         |  |
|---------------------------|-------------------------|--|
| <b>Syntax Description</b> | <i>channel_group_id</i> | The channel group ID.<br>The range is 0-5. |
|                           | <b>on</b>               | Configures the LACP static mode.           |
|                           | <b>active</b>           | Configures the LACP active mode            |
|                           | <b>passive</b>          | Configures the LACP passive mode           |

**Command Modes** Interface configuration (config-if)

### Examples

This example shows how to add a port to an aggregation group.

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 1/1
Device(config-if-ethernet-1/1)# channel-group 2 mode active
```

# clear channel-group

To clear the LACP statistical information, use the **clear channel-group *channel\_group\_id*** command in global configuration mode.

**clear channel-group [*channel\_group\_id*]**

|                           |   |  |
|---------------------------|---|--|
| <b>Syntax Description</b> | <i>channel_group_id</i>   | The channel group ID.<br>The range is 0-5. |
| <b>Command Modes</b>      | Global configuration (config)                                     |  |
| <b>Examples</b>           | This example shows how to clear the LACP statistical information. |  |

```
Device> enable
Device# configure terminal
Device(config)# clear channel-group
Clear channel group statistics information record successfully.
```

**clear interface**

# clear interface

To clear interface statistics information, use the **clear interface** command in global configuration mode.

**clear interface {slot-number | ethernet slot-number/port-number | gpon slot-number/port-number }**

|                           |   |   |
|---------------------------|---|---|
| <b>Syntax Description</b> | <p><i>slot-number</i></p> <p><i>slot-number/port-number</i></p> | <p>The slot number.<br/>The range is from 0 to 3.</p> <p>The port ID.</p> <ul style="list-style-type: none"> <li>• <i>slot-number</i>:</li> <li>• GPON: The value is 0.</li> <li>• GE Ethernet: The value is 1.</li> <li>• 10GE Ethernet: The value is 2.</li> </ul> <ul style="list-style-type: none"> <li>• <i>port-number</i>:</li> <li>• GPON: The range is from 1 to 3.</li> <li>• GE Ethernet: The range is from 1 to 3.</li> <li>• 10GE Ethernet: The range is from 1 to 3.</li> </ul> |
|---------------------------|---|---|

---

**Command Modes** Global configuration (config)

**Examples** This example shows how to clear interface statistics information

```
Device> enable
Device# configure terminal
Device(config)# clear interface ethernet 0/1
clear ports statistics information record successfully.
```

# interface range ethernet

To configure port mode in bulk, use the **interface range ethernet** command in interface configuration mode.

**interface range ethernet *slot-number/port-number* to ethernet *slot-number/port-number***

| Syntax Description | <i>slot-number/port-number</i> | The port ID. <ul style="list-style-type: none"><li>• <i>slot-number</i>:<ul style="list-style-type: none"><li>• GPON: The value is 0.</li><li>• GE Ethernet: The value is 1.</li><li>• 10GE Ethernet: The value is 2.</li></ul></li><li>• <i>port-number</i>:<ul style="list-style-type: none"><li>• GPON: The range is from 1 to 4.</li><li>• GE Ethernet: The range is from 1 to 4.</li><li>• 10GE Ethernet: The range is from 1 to 4.</li></ul></li></ul> |
|--------------------|--------------------------------|--|
|--------------------|--------------------------------|--|

**Command Modes** Interface configuration (config-if)

**Examples** This example shows how to configure port mode in bulk

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 1/1
Device(config-if-ethernet-1/1)# interface range ethernet 1/1 to ethernet 1/4
Device(config-if-range)#
Device#
```

# lacp port-priority

To configure port priority, use the **lacp port-priority** command in interface configuration mode. To disable port priority, use the **no lacp port-priority** command.

**lacp port-priority *priority\_value***

**no lacp port-priority**

|                           |                       |  |
|---------------------------|-----------------------|--|
| <b>Syntax Description</b> | <i>priority_value</i> | The priority value.<br>The range is from 1 to 65535. |
|---------------------------|-----------------------|--|

|                      |                                     |
|----------------------|-------------------------------------|
| <b>Command Modes</b> | Interface configuration (config-if) |
|----------------------|-------------------------------------|

|                 |  |
|-----------------|--|
| <b>Examples</b> | This example shows how to configure port priority. |
|-----------------|--|

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 1/1
Device(config-if-ethernet-1/1)# lacp port-priority 8
```

# lacp system-priority

To configure system priority, use the **lacp system-priority** command in global configuration mode. To disable port priority, use the **no lacp system-priority** command.

**lacp system-priority** *priority\_value*

**no lacp system-priority**

| Syntax Description | <i>priority_value</i> | The priority value.<br>The range is from 1 to 65535. |
|--------------------|-----------------------|--|
|--------------------|-----------------------|--|

**Command Modes** Global configuration (config)

**Examples** This example shows how to configure the system priority.

```
Device> enable
Device# configure terminal
Device(config)# lacp system-priority 3
```

**port-control mode primary**

## port-control mode primary

To configure the primary mode, use the **port-control mode primary** command in interface configuration mode. To disable the primary mode, use the **no port-control mode** command.

**port-control mode primary**  
**no port-control mode**

---

**Command Modes** Interface configuration (config-if)

---

**Examples** This example shows how to configure the primary mode.

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 1/1
Device(config-if-ethernet-1/1)# port-control mode primary
```

# port-control mode secondary

To configure the secondary mode, use the **port-control mode secondary** command in interface configuration mode. To disable the secondary mode, use the **no port-control mode** command.

**port-control mode secondary**  
**no port-control mode**

|                      |                                     |
|----------------------|-------------------------------------|
| <b>Command Modes</b> | Interface configuration (config-if) |
|----------------------|-------------------------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | This example shows how to configure the secondary mode. |
|-----------------|---|

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 1/1
Device(config-if-ethernet-1/1)# port-control mode secondary
```

# port-isolation

To configure port isolation, use the **port-isolation** command in global configuration mode. To disable port isolation, use the **no port-isolation** command.

**port-isolation ethernet slot-number/port-number**

**no port-isolation ethernet slot-number/port-number**

|                           |                                |   |
|---------------------------|--------------------------------|---|
| <b>Syntax Description</b> | <i>slot-number/port-number</i> | The port ID.  |
|                           |                                | <ul style="list-style-type: none"> <li>• <i>slot-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The value is 0.</li> <li>• GE Ethernet: The value is 1.</li> <li>• 10GE Ethernet: The value is 2.</li> </ul> </li> <br/> <li>• <i>port-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The range is from 1 to 32.</li> <li>• GE Ethernet: The range is from 1 to 32.</li> <li>• 10GE Ethernet: The range is from 1 to 32.</li> </ul> </li> </ul> |

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | This example shows how to configure port isolation. |
|-----------------|---|

```
Device> enable
Device# configure terminal
Device(config)# port-isolation ethernet 1/1
Add port isolation downlink port successfully.
```

| <b>Related Commands</b> | <b>Command</b>             | <b>Description</b>          |
|-------------------------|----------------------------|-----------------------------|
|                         | <b>show port-isolation</b> | Displays the isolation port |

# port-rate-statistics interval

To configure port interface statistic interval, use the **port-rate-statistics interval** *value* command in global configuration mode. To restore the default value, use the **no** form of this command.

**port-rate-statistics interval** *value*

**no port-rate-statistics interval**

| Syntax Description | <i>value</i> | The time interval range.<br>The range is from 1 to 5. The unit is minutes. The d |
|--------------------|--------------|--|
|--------------------|--------------|--|

**Command Modes** Global configuration (config)

**Examples** This example shows how to configure port interface statistic interval.

```
Device> enable
Device# configure terminal
Device(config)# port-rate-statistics interval 3
Port rate statistics interval has been changed, and will
restart calculating port average rate!
```

**psg group-id force-switch**

## psg group-id force-switch

To force a port changeover, use the **psg group-id force-switch** command in global configuration mode

**psg group-id force-switch**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <i>group-id</i> The protection switch group ID.<br>The range is 0 to 7. |
|---------------------------|---|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

|                 |  |
|-----------------|--|
| <b>Examples</b> | This example shows how to force a switch changeover. |
|-----------------|--|

```
Device> enable
Device# configure terminal
Device(config)# psg 1 type-b primary interface gpon 0/3 secondary interface gpon 0/1
Config success.
Device(config)# psg 1 force-switch
Switch success.
```

## psg group-id type-b

To configure a protection switch group, use the **psg group-id type-b primary interface gpon slot-number/port-number secondary interface gpon slot-number/port-number** command in global configuration mode. To remove the protection switch group, use the **no psg group-id** command.

```
psg group-id type-b primary interface gpon slot-number/port-number secondary interface gpon slot-number/port-number
no psg group-id
```

**show description**

# show description

To display the interface description, use the **show description** command in privileged EXEC or global configuration mode.

**show description interface ethernet slot-number/port-number**

**Syntax Description**

*slot-number/port-number*

The port ID.

- *slot-number*:
  - GPON: The value is 0.
  - GE Ethernet: The value is 1.
  - 10GE Ethernet: The value is 2.
- *port-number*:
  - GPON: The range is from 1 to 32.
  - GE Ethernet: The range is from 1 to 32.
  - 10GE Ethernet: The range is from 1 to 32.

**Command Modes**

Privileged EXEC (#)

Global configuration (config)

**Examples**

This example shows how to view the interface description.

```
Device> enable
Device# configure terminal
Device(config)# show description interface ethernet 1/1
Port      description
e1/1      text
Total entries: 1.
```

# show interface sfp

To display information about SFP parameters, use the **show interface sfp** command in privileged EXEC or global configuration mode.

**show interface sfp {ethernet | gpon }slot-number/port-number**

## Syntax Description

*slot-number/port-number*

The port ID.

- *slot-number*:

- GPON: The value is 0.
- GE Ethernet: The value is 1.
- 10GE Ethernet: The value is 2.

- *port-number*:

- GPON: The range is from 1 to 16.
- GE Ethernet: The range is from 1 to 48.
- 10GE Ethernet: The range is from 1 to 16.

## Command Modes

Privileged EXEC (#)

Global configuration (config)

## Examples

This example shows how to view the information about SFP parameters

```
Device> enable
Device# configure terminal
Device(config)# show interface sfp ethernet 1/1
```

**show lacp internal**

## show lacp internal

To display information of the aggregation group, use the **show lacp internal** command in privileged EXEC or global configuration mode.

**show lacp internal [channel\_group\_id]**

|                           |  |  |
|---------------------------|--|--|
| <b>Syntax Description</b> | <i>channel_group_id</i>                              | The channel group ID.<br>The range is from 0 to 5. |
| <b>Command Modes</b>      | Privileged EXEC (#)<br>Global configuration (config) |  |

### Examples

This example shows how to view information about the aggregation group.

```
Device> enable
Device# configure terminal
Device(config)# show lacp internal
Load balance: dst-ip

Channel: 2, static channel
Port      State    A-Key   O-Key   Priority   Logic-port   Actor-state
e1/1     down      -       -       -          9           -
                                                 
Channel: 4, dynamic channel
Port      State    A-Key   O-Key   Priority   Logic-port   Actor-state
actor-state: activity/timeout/aggregation/synchronization
               collecting/distributing/defaulted/expired
```

# show lacp neighbor

To display the neighbor information of the aggregation group, use the **show lacp neighbor** command in privileged EXEC or global configuration mode.

**show lacp neighbor [channel\_group\_id]**

|                           |  |  |
|---------------------------|--|--|
| <b>Syntax Description</b> | <i>channel_group_id</i>                              | The channel group ID.<br>The range is from 0 to 5. |
| <b>Command Modes</b>      | Privileged EXEC (#)<br>Global configuration (config) |  |

## Examples

This example shows how to view the neighbor information of the aggregation group

```
Device> enable
Device# configure terminal
Device(config)# show lacp neighbor

Channel: 4
Local  Port   Key   Pri     ID           Timeout    Nei-state
nei-state: activity/timeout/aggregation/synchronization
            collecting/distributing/defaulted/expired
```

**show lacp sys-id**

## show lacp sys-id

To display the system priority configuration, use the **show lacp sys-id** command in privileged EXEC or global configuration mode.

**show lacp sys-id**

---

**Command Modes** Privileged EXEC (#)

Global configuration (config)

---

**Examples**

This example shows how to view the system priority configuration.

```
Device> enable
Device# configure terminal
Device(config)# show lacp sys-id
3,000a5a9b1815
```

# show port-control mode

To display the configured port-control mode, use the **show port-control mode** command in privileged EXEC or global configuration mode.

## show port-control mode

**Command Modes** Privileged EXEC (#)

Global configuration (config)

**Examples** This example shows how to view the configured port-control mode.

```
Device> enable
Device# configure terminal
Device(config)# show port-control mode
port    negotiate-flag  port-control-mode
e1/1    enable          auto
e1/2    enable          auto
e1/3    enable          auto
e1/4    enable          auto
```

**show port-isolation**

# show port-isolation

To display the isolation port, use the **show port-isolation** command in privileged EXEC or global configuration mode.

## show port-isolation

**Command Modes** Privileged EXEC (#)

Global configuration (config)

## Examples

This example shows how to view isolation port configuration.

```
Device> enable
Device# configure terminal
Device(config)# show port-isolation
Port isolation downlink port :
e1/2-e1/4.
```

## Related Commands

| Command               | Description               |
|-----------------------|---------------------------|
| <b>port-isolation</b> | Configures port isolation |

# show psg

To display the protection switch group configurations, use the **show psg *group-id*** command in privileged EXEC or global configuration mode.

```
show psg { group-id | all }
```

## Syntax Description

|                 |  |
|-----------------|--|
| <i>group-id</i> | The protection switch group ID.<br>The range is from 0 to 7. |
| <b>all</b>      | All protection switch groups                                 |

## Command Modes

Privileged EXEC (#)

Global configuration (config)

## Examples

This example shows how to configure a protection switch group.

```
Device> enable
Device# configure terminal
Device(config)# show psg 0
GroupID      Member    Role        State
0            0/1      PRIMARY    WORKING
                  0/2      SECONDARY STANDBY
Total: 1.
```

show statistics interface ethernet

# show statistics interface ethernet

To display the port rate statistics information, use the **show statistics interface** command in privileged EXEC or global configuration mode.

**show statistics interface ethernet slot-number/port-number**

```

# show statistics

To display port rate statistics information, use the **show statistics interface ethernet** command in privileged EXEC or global configuration mode.

**show statistics interface ethernet slot-number/port-number**

|                           |                                |   |
|---------------------------|--------------------------------|---|
| <b>Syntax Description</b> | <i>slot-number/port-number</i> | The port ID.<br><ul style="list-style-type: none"> <li>• <i>slot-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The value is 0.</li> <li>• GE Ethernet: The value is 1.</li> <li>• 10GE Ethernet: The value is 1.</li> </ul> </li> <li>• <i>port-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The range is from 1 to 16.</li> <li>• GE Ethernet: The range is from 1 to 4.</li> <li>• 10GE Ethernet: The range is from 1 to 4.</li> </ul> </li> </ul> |
|---------------------------|--------------------------------|---|

**Command Modes** Privileged EXEC (#)

Global configuration (config)

**Examples** This example show how to view the port rate statistics information.

```
Device> enable
Device# configure terminal
Device(config)# show statistics interface ethernet 1/1
Port number : e1/1
last 5 minutes input rate 0 bits/sec, 0 packets/sec
last 5 minutes output rate 0 bits/sec, 0 packets/sec
64 byte packets:0
65-127 byte packets:0
128-255 byte packets:0
256-511 byte packets:0
512-1023 byte packets:0
1024-1518 byte packets:0
0 packets input, 0 bytes , 0 discarded packets
0 unicasts, 0 multicasts, 0 broadcasts
0 input errors, 0 FCS error, 0 symbol error, 0 false carrier
0 runts, 0 giants
0 packets output, 0 bytes, 0 discarded packets
0 unicasts, 0 multicasts, 0 broadcasts
0 output errors, 0 deferred, 0 collisions
0 late collisions
Total entries: 1.
```

**show statistics channel-group**

# show statistics channel-group

To display LACP statistical information, use the **show statistics channel-group** command in privileged EXEC or global configuration mode.

**show statistics channel-group [channel\_group\_id]**

|                           |  |  |
|---------------------------|--|--|
| <b>Syntax Description</b> | <i>channel_group_id</i>                              | The channel group ID.<br>The range is from 0 to 5. |
| <b>Command Modes</b>      | Privileged EXEC (#)<br>Global configuration (config) |  |

## Examples

This example shows how to view the LACP statistical information

```
Device> enable
Device# configure terminal
Device(config)# show statistics channel-group
Channel group : 2
last 5 minutes input rate 0 bits/sec, 0 packets/sec
last 5 minutes output rate 0 bits/sec, 0 packets/sec
64 byte packets:0
65-127 byte packets:0
128-255 byte packets:0
256-511 byte packets:0
512-1023 byte packets:0
1024-1518 byte packets:0
0 packets input, 0 bytes , 0 discarded packets
0 unicasts, 0 multicasts, 0 broadcasts
0 input errors, 0 FCS error, 0 symbol error, 0 false carrier
0 runts, 0 giants
0 packets output, 0 bytes, 0 discarded packets
0 unicasts, 0 multicasts, 0 broadcasts
0 output errors, 0 deferred, 0 collisions
0 late collisions

Channel group : 4

This channel group does not include any ports!

Total entries: 2.
```

# show statistics dynamic interface

To display the real-time statistic information of an interface, use the **show statistics dynamic interface** command in privileged EXEC or global configuration mode.

**show statistics dynamic interface**

**Command Modes** Privileged EXEC (#)

Global configuration (config)

**Examples** This example shows how to view the real-time statistic information of an interface.

```
Device> enable
Device# configure terminal
Device(config)# show statistics dynamic interface
Port Statistics          Sun Dec 9 17:40:29 2001

```

# speed

To configure the interface speed, use the **speed** command in interface configuration mode. To disable the interface speed, use the **no speed** command.

**speed {1000 | 10000 | auto}**

**no speed**

| Syntax Description |                         |
|--------------------|-------------------------|
| <b>1000</b>        | Port speed is 1000Mbps  |
| <b>10000</b>       | Port speed is 10000Mbps |
| <b>auto</b>        | Port speed is automatic |

**Command Modes** Interface configuration (config-if)

**Examples** This example shows how to configure the interface speed

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 1/1
Device(config-if-ethernet-1/1)# speed 1000
```

speed

**description**

# description

To add a VLAN name or a description for the VLAN use the **description** command in the VLAN configuration mode.

**description** *string*

---

**Syntax Description** *string* Specifies a name or a description for the VLAN. The range is 1-32 characters.

---

**Command Default** None

**Command Modes** VLAN Configuration

---

**Examples**

```
Device(config)# vlan 11
Device(config-if-vlan)# switchport ethernet 1/3
Device(config-if-vlan)# description "vlan1"
```

# ingress acceptable-frame

To configure the type of frames or VLAN packets that are acceptable on the port, use the **ingress acceptable-frame** command in the Interface configuration mode.

**ingress acceptable-frame { all | tagged }**

| Syntax Description | <b>all</b> Allows the port to receive tagged and untagged VLAN<br><b>tagged</b> Allows the port to receive only tagged VLAN packets. |
|--------------------|--|
| Command Default    | None   |
| Command Modes      | Interface configuration  |

**Examples** This example shows how to configure the **ingress acceptable-frame** command:

```
Device(config)#interface ethernet 1/1
Device(config-if-ethernet-1/1)#ingress acceptable-frame tagged
Config acceptable-frame type successfully!
```

# ingress filtering

To enable the forwarding of VLAN packets at the ingress of an interface, use the **ingress filtering** command in the Interface configuration mode. To disable ingress filtering use the **no** form of the command.

**ingress filtering**  
**no ingress filtering**

---

**Syntax Description**

**ingress filtering** enables ingress filtering of VLAN packets.

---

**Command Default**

Ingress filtering is enabled by default

**Command Modes**

Interface configuration mode

**Examples**

This example shows how to disable ingress filtering for a port:

```
Device(config)# interface ethernet 1/4
Device(config-if-ethernet-1/4)# no ingress filtering
```

# interface ethernet

To enter interface configuration mode for an Ethernet IEEE 802.3 interface, use the **interface ethernet** command in the global configuration mode.

**interface ethernet** *port-number*

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <i>port-number</i> Specifies the port number within a particular slot. |
|---------------------------|--|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                           |
|----------------------|---------------------------|
| <b>Command Modes</b> | Global configuration mode |
|----------------------|---------------------------|

|                 |  |
|-----------------|--|
| <b>Examples</b> | The following example shows how to enter interface configuration mode. |
|-----------------|--|

```
Device(config)# interface ethernet1/4
```

**priority**

# priority

To assign a priority value to a port use the **priority** command in the interface configuration mode. To restore the port priority to the default value use the **no** form of the command.

**priority** *port-priority*

**no priority**

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <i>port-priority</i> Assigns a priority value to the port. The value can range from 0-7. |
|---------------------------|--|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                              |
|----------------------|------------------------------|
| <b>Command Modes</b> | Interface configuration mode |
|----------------------|------------------------------|

|                 |  |
|-----------------|--|
| <b>Examples</b> | The following example shows how to configure the priority value of a port. |
|-----------------|--|

```
Device(config)# interface ethernet1/4
Device(config-if-ethernet-1/4)# priority 2
```

# show ingress interface

To display the status of filtering on the ingress port use the **show ingress interface** command in the privileged EXEC mode or global configuration mode.

**show ingress interface { ethernet port-number | gpon port-number }**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>ethernet</b> Displays information about ethernet port.<br><b>gpon</b> Displays information about gpon port |
|---------------------------|---|

|                      |  |
|----------------------|--|
| <b>Command Modes</b> | Privileged EXEC<br>Global configuration (config) |
|----------------------|--|

|                 |  |
|-----------------|--|
| <b>Examples</b> | The following is sample output for the show ingress interface command. |
|-----------------|--|

```
Device(config)#show ingress interface ethernet 1/4
Port      Filtering  Acceptable-frame
e1/4     enable      all
Total entries: 1
```

**show interface brief ethernet**

## show interface brief ethernet

To display the configurations of a port in brief use the **show interface brief ethernet** command in the privileged EXEC mode.

**show interface brief ethernet *port-number***

---

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <i>port-number</i> Specifies the port for which the configurations will be displayed. |
|---------------------------|---|

---

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                 |
|----------------------|-----------------|
| <b>Command Modes</b> | Privileged EXEC |
|----------------------|-----------------|

**Examples** This example shows the sample output for the **show interface brief ethernet** command:

```
Device# show interface brief ethernet 1/4
Port      Desc      Link  shutdn Speed      Pri  PVID Mode TagVlan      UtVlan
e1/4          down  false   auto          2    1    acc            1
Total entries: 1 .
```

# show interface ethernet

To display the configurations of a port in detail use the **show interface ethernet** command in the privileged EXEC mode.

**show interface ethernet *port-number***

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <i>port-number</i> Specifies the port for which the configurations will be displayed. |
| <b>Command Default</b>    | None  |
| <b>Command Modes</b>      | Privileged EXEC   |

**Examples** The following examples displays the output of the **show interface ethernet** command for the port etherent 1 / 4 :

```
Device# show interface ethernet 1/4
Gigabit Ethernet e1/4 current state: enabled, port link is down
Hardware address is 00:0a:5a:9b:18:15
SetSpeed is auto, ActualSpeed is unknown, Duplex mode is unknown
Current port type: 1000BASE-T
Priority is 2
Flow control is disabled
Broadcast storm control target rate is 49984pps
PVID is 1
Port mode: access
Untagged VLAN ID: 1
Input : 0 packets, 0 bytes
        0 broadcasts, 0 multicasts, 0 unicasts
Output : 0 packets, 0 bytes
        0 broadcasts, 0 multicasts, 0 unicasts
```

**switchport default vlan**

## switchport default vlan

To configure a VLAN as the default VLAN use the **switchport default vlan** command in the interface configuration mode. To restore the default vlan to port 1 use the **no** form of the command.

**switchport default vlan***vlan-id*

**no switchport default vlan**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <i>vlan-id</i> Specifies the VLAN id that will be used as the default VLAN. |
|---------------------------|---|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                              |
|----------------------|------------------------------|
| <b>Command Modes</b> | Interface configuration mode |
|----------------------|------------------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | This example shows how to configure a default vlan: |
|-----------------|---|

```
Device(config)# interface ethernet 1/1
Device(config-if-ethernet-1/1)# switchport mode access
Device(config-if-ethernet-1/1)# switchport default vlan 100
```

# switchport ethernet

To add an VLAN interface to a designated port or to all ports use the **switchport ethernet** command in the VLAN configuration mode.

**switchport { ethernet *port-number* | all }**

| Syntax Description | <b>all</b> Specifies that all the ports will be added to the VLAN interface.<br><br><b><i>port-number</i></b> Specifies the port numbers that will be added to the VLAN interface. |
|--------------------|--|
| Command Default    | None   |
| Command Modes      | VLAN configuration   |
| Examples           | This example shows how to add a VLAN to an ethernet port:<br><br>Device(config-if-vlan)# switchport ethernet 1/4   |

**switchport hybrid**

# switchport hybrid

To allow the packets from specified VLANs to pass through the hybrid port, use the **switchport hybrid** command in the interface configuration mode. To prevent the packets from specified VLANs passing through the hybrid port use the **no** form of the command.

**switchport hybrid { tagged | untagged } vlan { *vlan-list* | all }**

**no switchport hybrid { tagged | untagged } vlan { *vlan-list* | all }**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>tagged</b> Specifies the VLAN packets as tagged.<br><b>untagged</b> Specifies the VLAN packets as untagged.<br><b>vlan</b> Specifies the VLANs whose packets will be allowed to pass through the hybrid port.<br><b><i>vlan-list</i></b> Specifies a list of VLANs whose packets will be allowed to pass through the hybrid port.<br><b>all</b> Specifies that packets from all VLANs will be allowed to pass through the hybrid port. |
| <b>Command Default</b>    | None  |
| <b>Command Modes</b>      | Interface configuration mode  |
| <b>Examples</b>           | <p>This example shows how to allow the packets from the specified VLANs to pass through the hybrid port:</p> <pre>Device(config-if-ethernet-1/4)# switchport mode hybrid Device(config-if-ethernet-1/4)# switchport hybrid tagged 2-4</pre>   |

# switchport mode

To configure the VLAN mode for the interface use the **switchport mode** command in the interface configuration mode. You can set the VLAN mode to access, hybrid or trunk. The mode is set to hybrid by default.

**switchport mode { access | hybrid | trunk }**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> |   |
| <b>access</b>             | Specifies that the interface is in access mode. |
| <b>hybrid</b>             | Specifies that the interface is in hybrid mode. |
| <b>trunk</b>              | Specifies that the interface is in trunk mode.  |
| <b>Command Default</b>    | None  |
| <b>Command Modes</b>      | Interface configuration                         |

**Examples** This example shows how to configure the VLAN mode to trunk on an interface:

```
Device(config)# interface ethernet1/4
Device(config-if-ethernet-1/4)# switchport mode trunk
```

**switchport trunk**

# switchport trunk

To allow the packets from specified VLANs to pass through the trunk port, use the **switchport trunk** command in the interface configuration mode. To prevent the packets from specified VLANs passing through the hybrid port use the **no** form of the command.

**switchport trunk allowed vlan { *vlan-list* | all }**

**no switchport trunk allowed vlan { *vlan-list* | all }**

---

**Syntax Description**

- allowed** Configures the VLANs whose packets will be allowed to pass through the trunk port.
  - vlan** Specifies the VLANs whose packets will be allowed to pass through the trunk port.
  - vlan-list** Specifies VLAN IDs of the allowed VLANs when the interface is in trunking mode.
  - all** Specifies all VLANs to be added to the current list.
- 

**Command Default**

None

**Command Modes**

Interface configuration

**Examples**

This example shows how to allow the packets from the specified VLANs to pass through a trunk port:

```
Device(config-if-ethernet-1/4)# switchport mode trunk
Device(config-if-ethernet-1/4)# switchport trunk allowed vlan 2-4
```

# vlan

To add a VLAN and to enter the VLAN configuration mode, use the **vlan** command in global configuration mode. To delete the VLAN, use the **no** form of this command.

**vlan *vlan list***

**no vlan *vlan list***

---

**Syntax Description**

*vlan list* List of VLAN to be added and configured. The range is 1 to 4094. You can enter a single VLAN ID, a series of VLAN IDs separated by commas, or a range of VLAN IDs separated by hyphens.

---

**Command Default**

None

**Command Modes**

Global Configuration

**Examples**

This example shows how to create a VLAN and enter the VLAN configuration mode:

```
Device(config)# vlan 1
```

vlan

## arp

To add a static entry in the Address Resolution Protocol (ARP) table, use the **arp** command in the global configuration mode. To remove an entry from the ARP table, use the **no** form of the command.

[**no**] **arp***ip-address macmac-address [vid vlan-id | port port-id]*

|                                  |  |                   |  |                                  |  |                           |   |                            |  |
|----------------------------------|--|-------------------|--|----------------------------------|--|---------------------------|---|----------------------------|--|
| <b>Syntax Description</b>        | <table border="0"> <tr> <td><i>ip-address</i></td><td>IPv4 address for which a permanent entry is added to the ARP table. Enter the IPv4 address in a four-part dotted-decimal format that corresponds to the local data-link address (a 32-bit address)</td></tr> <tr> <td><b>mac</b><br/><i>mac-address</i></td><td>Hardware MAC address that the IPv4 address is linked to. Enter the IPv4 address in a four-part dotted-decimal format that corresponds to the local data-link address (a 32-bit address) | <b>mac</b><br><i>mac-address</i> | Hardware MAC address that the IPv4 address is linked to. Enter the MAC address in dotted-hexadecimal notation. | <b>vid</b> <i>vlan-id</i> | (Optional) Specifies the configured VLAN. | <b>port</b> <i>port-id</i> | (Optional) Specifies the configured port |
| <i>ip-address</i>                | IPv4 address for which a permanent entry is added to the ARP table. Enter the IPv4 address in a four-part dotted-decimal format that corresponds to the local data-link address (a 32-bit address)   |                   |  |                                  |  |                           |   |                            |  |
| <b>mac</b><br><i>mac-address</i> | Hardware MAC address that the IPv4 address is linked to. Enter the MAC address in dotted-hexadecimal notation.   |                   |  |                                  |  |                           |   |                            |  |
| <b>vid</b> <i>vlan-id</i>        | (Optional) Specifies the configured VLAN.  |                   |  |                                  |  |                           |   |                            |  |
| <b>port</b> <i>port-id</i>       | (Optional) Specifies the configured port   |                   |  |                                  |  |                           |   |                            |  |
| <b>Command Default</b>           | None   |                   |  |                                  |  |                           |   |                            |  |
| <b>Command Modes</b>             | Global configuration (config)  |                   |  |                                  |  |                           |   |                            |  |
| <b>Usage Guidelines</b>          | <p>You can manually configure and maintain a static ARP entry. It cannot be aged or overwritten by dynamic ARP entry. A static ARP entry can be a long or a short entry. A static ARP entry comprises IP address and the corresponding MAC address. A long static ARP entry comprises the VLAN and egress interface details along with the IP address and MAC address. Long Static ARP entries can be directly used for packet forwarding.</p> <p>When you manually configure a Long Static ARP entry, the IP address in the entry must be in the same network segment as the IP address of the VLAN interface on which the egress interface resides.</p> <p>A short static ARP entry comprises the IP Address and the MAC Address. A short static ARP entry cannot be directly used for packet forwarding. A shorts static ARP request packet is sent by the host. If the source IP address and the source MAC address in the received response packet are the same as the configured IP address and MAC address, the ARP entry will be completed. Then it can be used for packet forwarding.</p> |                   |  |                                  |  |                           |   |                            |  |

### Example

This example shows how to configure a short static ARP entry:

```
Device> enable
Device# configure terminal
Device(config)# arp 192.168.1.19 mac 00:02:9a:3b:94:d9
```

# arp aging-time

To specify how long an entry can exist in an ARP table, use the **arp aging-time** command in the global configuration mode.

**arp aging-time** *aging-time*

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <i>aging-time</i> Specify the timeout period in seconds. |
|---------------------------|--|

|                        |  |
|------------------------|--|
| <b>Command Default</b> | The default timeout of an ARP table entry is 20 minutes. |
|------------------------|--|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

## Example

This example shows how to configure the aging time for ARP table entries:

```
Device> enable
Device# configure terminal
Device(config)# arp aging-time 300
```

```
description interface-name
```

## description *interface-name*

To configure the interface description, use the **description** *interface name* in the VLAN configuration mode. You can delete the interface description by using the **no** form of the command.

```
description interface-name
```

```
no description interface-name
```

---

**Syntax Description** *interface-name* Adds a description for the interface.

---

**Command Default** None

**Command Modes** VLAN configuration

**Examples** The following example shows how to configure the IP interface description

```
Device(config-if-vlanif)# description interface1
```

# dhcp-snooping

To enable Dynamic Host Control Protocol (DHCP) snooping feature on a device, use the **dhcp-snooping** command in the global configuration mode.

**dhcp-snooping [port-down-action fast-remove ]**

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>port-down-action fast-remove</b> Configures the link down operation on the port.  |
| <b>Command Default</b>    | None   |
| <b>Command Modes</b>      | Global configuration (config)  |
| <b>Usage Guidelines</b>   | <p>When DHCP Snooping is enabled on your device, it monitors and validates the DHCP packets that it receives. Untrusted ports drop the DHCP-ACK and DHCP-OFFER packets that are received from DHCP servers. Trusted ports forward the received DHCP packets to DHCP clients.</p> <p>To configure DHCP Snooping feature, use the <b>dhcp-snooping</b> command.</p> <p>When a link in the network goes down, use the <b>dhcp-snooping port-down-action fast remove</b> command to remove the corresponding entry from the DHCP binding database.</p> |

## Example

This example shows how to configure DHCP Snooping on a device:

```
Device> enable
Device# configure terminal
Device(config)# dhcp-snooping
```

# dhcp-snooping trust

To configure an interface as trusted for Dynamic Host Control Protocol (DHCP) snooping operations, use the **dhcp-snooping trust** command in the interface configuration mode.

## dhcp-snooping trust

|                        |                               |
|------------------------|-------------------------------|
| <b>Command Default</b> | None                          |
| <b>Command Modes</b>   | Global configuration (config) |

## Example

This example shows how to configure a trusted interface for DHCP Snooping:

```
Device> enable
Device# configure terminal
Device(config)# interface g0/1
Device(config-if)# dhcp-snooping trust
```

# dhcpv6-snooping

To enable Dynamic Host Control Protocol version 6 (DHCPv6) snooping feature on a device, use the **dhcpv6-snooping** command in the global configuration mode.

**dhcpv6-snooping [ port-down-action fast-remove ]**

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>port-down-action fast-remove</b> Configures the link down operation on the port.  |
| <b>Command Default</b>    | None   |
| <b>Command Modes</b>      | Global configuration (config)  |
| <b>Usage Guidelines</b>   | <p>When DHCPv6 Snooping is enabled on your device, it monitors and validates the DHCP packets that it receives. Untrusted ports drop the DHCP-ACK and DHCP-OFFER packets that are received from DHCP servers. Trusted ports forward the received DHCP packets to DHCP clients.</p> <p>To configure DHCPv6 Snooping feature, use the <b>dhcpv6-snooping</b> command.</p> <p>When a link in the network goes down, use the <b>dhcpv6-snooping port-down-action fast remove</b> command to remove the corresponding entry from the DHCP binding database.</p> |

## Example

This example shows how to configure DHCPv6 Snooping on a device:

```
Device> enable
Device# configure terminal
Device(config)# dhcpv6-snooping
```

**dhcpv6 snooping port-down-action fast-remove**

## dhcpv6 snooping port-down-action fast-remove

To configure the link-down operation on the port, use the **dhcp-snooping port-down-action fast-remove** command in the interface configuration mode.

**dhcp-snooping port-down-action fast remove**

**Command Default** None

**Command Modes** Global configuration (config)

### Example

This example shows how to configure the link-down operation on the port:

```
Device> enable
Device# configure terminal
Device(config)# dhcp-snooping port-down-action fast-remove
```

# dhcpv6-snooping trust

To configure an interface as trusted for DHCPv6 snooping operations, use the **dhcpv6-snooping trust** command in the interface configuration mode.

## dhcpv6-snooping trust

**Command Default** None

**Command Modes** Global configuration (config)

### Example

This example shows how to configure a trusted interface for DHCPv6 Snooping:

```
Device> enable
Device# configure terminal
Device(config)# interface g0/1
Device(config-if)# dhcpv6-snooping trust
```

**dlf forward**

# dlf forward

To enable the forwarding of Destination Lookup Failure (DLF) unicast or multicast packets, use the **dlf forward** command. To enable DLF forwarding on egress packets of all ports, use the command in the global configuration mode. To enable DLF forwarding on the egress packets of a specific port, use the command in the interface configuration mode. DLF Forwarding is disabled by default. To disable it use the **no** form of the command.

**dlf-forward { unicast | multicast }**

**no dlf-forward { unicast | multicast }**

---

## Syntax Description

*unicast* Enables the forwarding function of DLF unicast packets

*multicast* Enables the forwarding function of DLF multicast packets

---

---

## Command Default

DLF forwarding is disabled by default.

---

## Command Modes

Global configuration mode.

Interface configuration mode.

---

## Examples

The following example shows how to configure DLF forwarding for unicast packets for all egress ports:

```
Device(config)# dlf-forward unicast
```

The following example shows how to configure DLF forwarding for unicast packets on a specific port:

```
Device(config)# interface ethernet 1/4
Device(config-if)# dlf-forward unicast
```

The following example shows how to configure DLF forwarding for multicast packets for all egress ports:

```
Device(config)# dlf-forward multicast
```

The following example shows how to configure DLF forwarding for multicast packets on a specific port:

```
Device(config)# interface ethernet 1/4
Device(config-if)# dlf-forward multicast
```

# clear dhcipv6-snooping

To delete the dynamic entries that is recorded by DHCPv6 Snooping, use the **clear dhcipv6-snooping** command in global configuration mode.

```
clear dhcipv6-snooping { ip address | mac mac_address | vlan vlan_id | interface ethernet slot-num/pon-num/ont-num }
```

|                                 |                                   |
|---------------------------------|-----------------------------------|
| <b>Syntax Description</b>       |                                   |
| <i>address</i>                  | Specifies the IPv6 address entry  |
| <i>mac_address</i>              | Specified the MAC address entry   |
| <i>vlan_id</i>                  | Specifies the VLAN ID entry       |
| <i>slot-num/pon-num/ont-num</i> | Specifies the ethernet port entry |
| <b>Command Default</b>          | None                              |
| <b>Command Modes</b>            | Global Configuration (config)     |

## Example

The following example shows a sample format of the output of this command:

```
Device(config)# clear dhcipv6-snooping
```

# interface

To configure an interface and enter into Interface configuration mode, use the **interface** command in the global configuration mode.

```
interface {port-id | ethernet slot-num/port-num | gpon slot-num/port-num | loopback-interface
loopback-int-number | meth-interface meth-int-number | range {ethernet port-num/slot-num | gpon
port-num/slot-num } | vlan-interface vlan-id }
```

|   |  |
|---|--|
| <b>Syntax Description</b>   |  |
| <b>port-id</b>  | Specifies the port to be configured.<br>It is a string consisting of 4 to 14 characters.   |
| <b>ethernet slot-num/port-num</b>                                   | Enables you to configure Ethernet ports.<br>For a Gigabit Ethernet port, <i>slot-num</i> is 1 and <i>port-num</i> ranges from 1 through 4.<br>For a Ten Gigabit Ethernet port, <i>slot-num</i> is 2 and <i>port-num</i> ranges from 1 through 2. |
| <b>gpon slot-num/port-num</b>                                       | Enables you to configure GPON ports.<br><i>slot-num</i> is 0 and <i>port-num</i> ranges from 1 through 8.  |
| <b>loopback-interface</b><br><b>loopback-int-number</b>             | Enables you to configure a loopback interface. <i>loopback-int-number</i> number can be 0 or 1.  |
| <b>meth-interface meth-int-number</b>                               | Enables you to configure the Management Interface, MEth, that allows you to log in and perform configurations.   |
| <b>range {ethernet port-num/slot-num   gpon port-num/slot-num }</b> | Enables you to configure a range of ethernet interfaces or a range of GPON interfaces.   |
| <b>vlan-interface vlan-id</b>                                       | Enables you to configure a VLAN interface.<br><i>vlan-id</i> specifies the VLAN id. Values range from 1 through 4094.  |

|                         |   |
|-------------------------|---|
| <b>Command Modes</b>    | Global Configuration (config)   |
| <b>Command Default</b>  | None  |
| <b>Usage Guidelines</b> | <p>Use the <b>interface</b> command to enter the Interface Configuration mode and configure the interface.</p> <p>To configure a range of interfaces at once, use the <b>interface range</b> command. In the interface range configuration mode, all entered commands are applicable to all interfaces within that range.</p> |

## Example

The following example configures an Ethernet interface:

```
Device#configure terminal
Device(config)#interface ethernet 1/1
Device(config-if-ethernet-1/1) #
```

The following example configures a range of GPON interfaces:

```
Device#configure terminal  
Device(config)#interface range gpon 0/1 to gpon 0/3
```

**interface loopback-interface**

# interface loopback-interface

To create a loopback interface and to enter the loopback interface configuration mode, use the **interface loopback-interface** command in the Global configuration mode.

To disable a loopback interface use the **no** form of the command.

**interface loopback-interface *interface-number***

**no interface loopback-interface**

---

## Syntax Description

**loopback-interface** Configures a loopback interface.

***interface-number*** Configures the loopback interface number.

---

## Command Default

None

## Command Modes

Global configuration mode

## Examples

The following example shows how to configure a loopback interface:

```
Device(config)# interface loopback-interface 1
```

# interface vlan-interface

To create a VLAN interface and enter interface configuration mode, use the **interface vlan-interface** command in the global configuration mode. To remove a VLAN interface, use the **no** form of the command.

**interfacevlan-interface *vlan-id***

**no interfacevlan-interface**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <i>vlan-id</i> Sets the VLAN for the interface. The range is from 1-4094. |
|---------------------------|---|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                      |
|----------------------|----------------------|
| <b>Command Modes</b> | Global configuration |
|----------------------|----------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example shows how to configure an interface VLAN: |
|-----------------|---|

```
Device(config)# interface vlan-interface 1
```

# ip-source-guard

To enable IP Source Guard feature on a device, use the **ip-source-guard** command in the global configuration mode.

```
ip-source-guard { vlan vlan-list | permit igmp | bind ip ip-address [mac mac-address interface { ethernet | gpon } interface-id vlan vlan-id] }
```

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <p><b>vlan <i>vlan-list</i></b> Configures IP Source Guard on the VLANs listed by <i>vlan-list</i>.</p> <p><b>permit igmp</b> Configures IP Source Guard to allow Internet Group Management Protocol (IGMP) packets to pass through.</p> <p><b>bind ip <i>ip-address</i></b> Configures an entry in the static IP source binding table.</p> <p><b>mac <i>mac-address</i></b> The MAC address that is bound to the IP address.</p> <p><b>interface</b> Specifies the interface to be configured.</p> <p><b>ethernet</b> Specifies the Ethernet interface</p> <p><b>gpon</b> Specifies the GPON interface</p> <p><b>vlan <i>vlan-id</i></b> Specifies the VLAN to which the interface belongs.</p> |
| <b>Command Default</b>    | None   |
| <b>Command Modes</b>      | Global configuration (config)  |
| <b>Usage Guidelines</b>   | <p>IP Source Guard feature filters the source IP address on a Layer 2 port to prevent a malicious host from impersonating a legitimate host.</p> <p>You can enable the IP Source Guard feature only on untrusted ports. For IP Source Guard to function, enable DHCP Snooping.</p> <p>Use the <b>ip-source-guard bind</b> command to configure an IP source binding.</p> <p>Use the <b>ip-source-guard vlan <i>vlan-list</i></b> command to configure IP Source Guard on the listed VLANs.</p> <p>Use the <b>ip-source-guard permit igmp</b> command to allow IGMP packets to pass through.</p>  |

## Example

The following example shows how to configure an entry in the IP source binding table:

```
Device> enable
Device# configure terminal
Device(config)# ip-source-guard bind ip 192.168.11.2
```

The following example shows how to configure ip source guard on three VLANs:

```
Device(config)# ip-source-guard vlan 7,8,10
```

# ip-source-guard filter

To configure the port filtering mode for an interface, use the **ip-source-guard** command in the interface configuration mode.

```
ip-source-guard [ip | ip-mac | ip-mac-vlan]
```

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>ip</b> Specifies that the port filter packets are based on source IP, regardless of the MAC address and the VLAN ID.<br><b>ip-mac</b> Specifies that the port filters packets based on the source IP address and the MAC address of the packet.<br><b>ip-mac-vlan</b> Specifies that the port filters packets based on source IP address, MAC address, and VLAN ID.   |
| <b>Command Default</b>    | None   |
| <b>Command Modes</b>      | Interface Configuration (config-if)  |
| <b>Usage Guidelines</b>   | <p>IP Source Guard feature filters the source IP address on a Layer 2 port to prevent a malicious host from impersonating a legitimate host.</p> <p>You can enable the IP Source Guard feature only on untrusted ports. For IP Source Guard to function, enable DHCP Snooping.</p> <p>Use the <b>ip-source-guard ip</b> command on the interface to filter packets are based on source IP, regardless of the MAC address and the VLAN ID.</p> <p>Use the <b>ip-source-guard ip-mac <i>vlan-list</i></b> command on the interface to filter packets are based on source IP and MAC address, regardless of the VLAN ID.</p> <p>Use the <b>ip-source-guard ip-mac-vlan</b> command on the interface to filter packets are based on source IP, MAC address, and VLAN ID.</p> <p>If you don't specify the port filtering mode, the port filters packets based on the source IP address, MAC address, and VLAN ID.</p> |

## Example

The following example shows how to configure the port to filter packets based on the source IP address and MAC address:

```
Device> enable
Device# configure terminal
Device(config)# interface etherent 1/1

Device(config-if-etherent-1/1)# ip-source-guard ip-mac
Config IP source guard mode of port successfully.
```

**ip address**

# ip address

To configure the primary IP address for the VLAN interface, use the **ip address** command in the VLAN configuration mode.

```
ip address { ip-address mask-ip-address override | primary ip-address }
```

**Syntax Description**

**Override** Overrides the IP address of the VLAN interface.

**primary** Configures the primary IP address for the VLAN interface.

**Command Default**

None

**Command Modes**

VLAN configuration

**Examples**

The following example shows how to configure the primary IP address for an interface:

```
Device(config-if-vlan)# ip address primary 192.0.2.1
```

# ip address *mask-ip-address*

To configure a loopback interface for the IP address, use the **ip address *mask-ip-address*** command in the loopback interface configuration mode.

To disable the loopback loopback interface for the IP address, use the **no** form of the command.

**ip address*ip-address* *mask-ip-address***

**no ip address*ip-address* *mask-ip-address***

---

**Syntax Description**

*ip-address* It is the IP address of the interface

---

*mask-ip-address* Configures the loopback IP address for the interface.

---

**Command Default**

None

**Command Modes**

Loopback interface configuration mode

**Examples**

The following example shows how to configure a loopback interface for the IP address

```
Device(config-if-loopbackinterface)# ip address 192.0.2.1 255.255.255.0
```

**ip address range**

# ip address range

To configure the range of IP addresses for the VLAN interface, use the **ip address range** command in the the VLAN configuration mode. You can delete the range of IP addresses for the VLAN interface using the **no** form of the command.

**ip address range { start-ip-address end-ip-address }**

**no ip address range { start-ip-address end-ip-address }**

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>range</b> Configures the range of IP addresses for the VLAN interface<br><b>start-ip-address</b> Configures the starting IP address of the range.<br><b>end-ip-address</b> Configures the ending IP address of the range. |
| <b>Command Default</b>    | None   |
| <b>Command Modes</b>      | VLAN configuration mode  |
| <b>Examples</b>           | The following example shows how to configure a range of IP addresses for the interface:<br><br>Device(config-if-vlan)# <b>ip address range 192.0.2.254 192.0.2.255</b>   |

# ip icmp mask-reply

To enable the ICMP address mask reply packet, use the **ip icmp mask-reply** command in the global configuration mode. To disable the ICMP address mask reply packet, use the **no** form of the command.

**ip icmp mask-reply**

**no ip icmp mask-reply**

---

**Syntax Description**

**mask-reply** Enables the ICMP address mask reply packet.

---

**Command Default**

None

**Command Modes**

Global configuration mode

**Examples**

The following example shows how to enable ICMP address mask reply packet:

```
Device(config)# ip icmp mask-reply
```

**ip icmp unreachable**

# ip icmp unreachable

To enable the sending of ICMP destination unreachable packets, use the **ip icmp unreachable** command in the VLAN configuration mode. To disable the sending of ICMP destination unreachable packets, use the **no** form of the command.

**ip icmp unreachable****no ip icmp unreachable****Syntax Description****unreachable** Enables the sending of ICMP destination unreachable packets.**Command Default**

None

**Command Modes**

VLAN configuration mode

**Examples**

The following example shows how to enable the sending of ICMP destination unreachable packets.

```
Device(config-if-vlanif)# ip icmp unreachable
```

# ipv6 address

To configure the IPv6 address for the VLAN interface, use the **ipv6 address** command in the VLAN configuration mode. To delete the IPv6 address use the **no** form of the command.

**ipv6 address { ipv6-address-mask ipv6-address/prefixlength | autoconfig }**

**no ipv6 address { ipv6-address-mask ipv6-address/prefixlength | autoconfig }**

## Syntax Description

*ipv6-address/prefixlength* Specifies the IPv6 prefix for the VLAN interface.

*ipv6-address-mask* Specifies the IPv6 destination address for the VLAN interface.

**autoconfig** Enables stateless autoconfiguration.

## Command Default

None.

## Command Modes

VLAN configuration

## Examples

The following example shows how to configure the IPv6 address for an interface:

```
Device> enable
Device# configure terminal
Device(config)# interface vlan-interface 100
Device(config-if-vlan)# ipv6 address 2001::100/64
```

# ipv6 address link-local

To specify the link local address manually on a VLAN interface, use the **ipv6 address link-local** command in the VLAN configuration mode. The link-local is automatically formed by default.

**ipv6 address *ipv6-address* link-local**

| Syntax Description     | <i>ipv6-address</i>                                | Specifies the IPv6 prefix for the VLAN interface. |
|------------------------|--|---|
|                        | <b>link-local</b>                                  | Configures a link-local IPv6 address.             |
| <b>Command Default</b> | The link-local is automatically formed by default. |   |
| <b>Command Modes</b>   | VLAN configuration                                 |   |

The following example shows how to configure a link-local IPv6 address on a VLAN interface using the **ipv6 address link-local** command.

```
Device> enable
Device#configure terminal
Device(config)# ipv6 enable
Device(config)# interface vlan-interface 1
Device(config-vlan-if)# ipv6 address FE80:1::100 link-local
```

# ipv6 enable

To enable IPv6 forwarding, use the **ipv6 enable** command in global configuration mode. To disable IPv6 forwarding, use the **ipv6 disable** command in global configuration mode.

**ipv6 { enable | disable }**

|                           |                |                           |
|---------------------------|----------------|---------------------------|
| <b>Syntax Description</b> | <b>enable</b>  | Enables IPv6 forwarding.  |
|                           | <b>disable</b> | Disables IPv6 forwarding. |

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

The following example shows how to enable IPv6 forwarding using the **ipv6 enable** command:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 enable
```

**ipv6 icmpv6 multicast-echo-reply**

## ipv6 icmpv6 multicast-echo-reply

To enable an echo-reply for an echo request, use the **ipv6 icmpv6 multicast-echo-reply** command in global configuration mode. You can use the **no ipv6 icmpv6 multicast-echo-reply** command to disable reply for multicast packets.

**ipv6 icmpv6 multicast-echo-reply enable**

**no ipv6 icmpv6 multicast-echo-reply**

|                           |                                    |  |
|---------------------------|------------------------------------|--|
| <b>Syntax Description</b> | <code>enable</code>                | Enables echo reply for multicast packets |
| <b>Command Default</b>    | None.                              |  |
| <b>Command Modes</b>      | Global configuration mode (config) |  |

The following example shows how to enable echo reply for multicast packets by using the **ipv6 icmpv6 multicast-echo-reply enable** command in global configuration mode.

```
Device> enable
Device# configure terminal
Device(config)# ipv6 icmpv6 multicast-echo-reply enable
```

# ipv6 nd dad attempts

To configure the number of times Neighbor Solicitation (NS) messages will be sent for duplicate address detection, use the **ipv6 nd dad attempts** command in global configuration mode. You can use the **no ipv6 nd dad attempts** command to configure the number of NS messages sent to the value of 0.

**ipv6 nd dad attempts** *value*

**no ipv6 nd dad attempts**

|                           |                                    |  |
|---------------------------|------------------------------------|--|
| <b>Syntax Description</b> | <i>value</i>                       | Configures the number of times NS messages are sent for duplicate address detection. The value ranges from 0 to 20. the default value for the number of NS messages sent is 1. When value is 0, it implies duplicate address detection is disabled |
| <b>Command Default</b>    | None.                              |  |
| <b>Command Modes</b>      | Global configuration mode (config) |  |

The following example shows how to configure the number of NS messages sent for duplicate address detection to 10, using the **ipv6 nd dad attempts** command in global configuration mode.

```
Device> enable
Device# configure terminal
Device(config)# ipv6 nd dad attempts 10
```

**ipv6 nd ns retrans-time**

## ipv6 nd ns retrans-time

To set the time interval for retransmitting the Neighbor Solicitation (NS) message, use the **ipv6 nd ns retrans-time** command in global configuration mode. You can use the **no ipv6 nd ns retrans-time** command to disable the retransmission timer.

**ipv6 nd ns retrans-time** *value*

**no ipv6 nd ns retrans-time**

---

|                           |                                    |   |
|---------------------------|------------------------------------|---|
| <b>Syntax Description</b> | <i>value</i>                       | Sets the time interval for retransmitting the NS message. The value ranges from 1 to 3600 seconds. The default value for retransmitting the NS message is 1 second. |
| <b>Command Default</b>    | None.                              |   |
| <b>Command Modes</b>      | Global configuration mode (config) |   |

---

The following example shows how to set the time interval for retransmitting the NS message to 60 seconds using the **ipv6 nd ns retrans-time** command in global configuration mode.

```
Device> enable
Device# configure terminal
Device(config)# ipv6 nd ns retrans-time 60
```

# ipv6 nd reachable-time

To configure the time for which a neighbor is considered to be in a reachable state, use the **ipv6 nd reachable-time** command in the global configuration mode. You can use the **no ipv6 nd reachable-time** command to reset the reachable time to its default value of 30 seconds.

**ipv6 nd reachable-time *value***

**no ipv6 nd reachable-time**

| Syntax Description     | <i>value</i>   | Configures the time for which a neighbor is considered to be in a reachable state. The value ranges from 1-3600 seconds. The default value is 30 seconds. |
|------------------------|--|---|
| <b>Command Default</b> | The default value of the reachable time is 30 seconds. |   |
| <b>Command Modes</b>   | Global configuration mode (config)                     |   |

The following example shows how to configure the reachable-time to 60 seconds, using the **ipv6 nd reachable-time** command in global configuration mode.

```
Device> enable
Device# configure terminal
Device(config)# ipv6 nd reachable-time 60
```

**ipv6 neighbors max-learning-num**

## ipv6 neighbors max-learning-num

To configure the maximum number of neighbors that can access an IPv6 address, use the **ipv6 neighbors max-learning-num** command in the global configuration mode. The maximum neighbor number includes both static and dynamic neighbors. You can use the **no ipv6 neighbors max-learning-num** command to reset the maximum number of neighbors to the default value of 64.

**ipv6 neighbors max-learning-num *number***

**no ipv6 neighbors max-learning-num**

---

| Syntax Description | <i>number</i> | Configures the maximum number of neighbors for an IPv6 address. The range for the number is 1 to 2560. The default maximum number of neighbors is 64. |
|--------------------|---------------|---|
|--------------------|---------------|---|

---

|                        |  |
|------------------------|--|
| <b>Command Default</b> | The default maximum number of neighbors is 64. |
|------------------------|--|

|                      |                                    |
|----------------------|------------------------------------|
| <b>Command Modes</b> | Global configuration mode (config) |
|----------------------|------------------------------------|

The following example shows how to configure the maximum neighbor number to 1000 using the **ipv6 neighbors max-learning num** command in global configuration mode.

```
Device> enable
Device# configure terminal
Device(config)# ipv6 neighbors max-learning-num 1000
```

# ipv6 path

To configure the Maximum Transmission Unit (MTU) value for an IPv6 interface, use the **ipv6 path** command in the VLAN interface configuration mode. You can use the **no ipv6 path** command to reset the MTU value to its default value of 1500.

**ipv6 path *mtu-value***

**no ipv6 path *mtu-value***

|                           |                  |  |
|---------------------------|------------------|--|
| <b>Syntax Description</b> | <i>mtu-value</i> | Configures the MTU for the IPv6 interface. The MTU value ranges from 1280-1500. The default MTU value is 1500. |
|---------------------------|------------------|--|

|                        |                                 |
|------------------------|---------------------------------|
| <b>Command Default</b> | The default MTU value is 1500 . |
|------------------------|---------------------------------|

|                      |                    |
|----------------------|--------------------|
| <b>Command Modes</b> | VLAN configuration |
|----------------------|--------------------|

The following example shows how to set the MTU value to 2000 for an IPv6 interface, using the **ipv6 path** command in VLAN configuration mode.

```
Device> enable
Device# configure terminal
Device(config)# interface vlan-interface 100
Device(config-vlan_if)# ipv6 path 2000
```

# ipv6 route

To configure a static route with the IPv6 address, use the **ipv6 route** command in global configuration mode. To disable static route, use the **no** form of the command.

**ipv6 route** { *ipv6-address/prefixlength* *ipv6-address/prefixlength* } *next-hop-address*

**no ipv6 route** { *ipv6-address/prefixlength* *ipv6-address/prefixlength* } *next-hop-address*

|                                  |  |                                  |                            |                                  |   |                         |                                      |
|----------------------------------|--|----------------------------------|----------------------------|----------------------------------|---|-------------------------|--------------------------------------|
| <b>Syntax Description</b>        | <table border="0"> <tr> <td><i>ipv6-address/prefixlength</i></td><td>Specifies the IPv6 prefix.</td></tr> <tr> <td><i>ipv6-address/prefixlength</i></td><td>Specifies the IPv6 destination address.</td></tr> <tr> <td><i>next-hop-address</i></td><td>Specifies the IPv6 next hop address.</td></tr> </table> | <i>ipv6-address/prefixlength</i> | Specifies the IPv6 prefix. | <i>ipv6-address/prefixlength</i> | Specifies the IPv6 destination address. | <i>next-hop-address</i> | Specifies the IPv6 next hop address. |
| <i>ipv6-address/prefixlength</i> | Specifies the IPv6 prefix.   |                                  |                            |                                  |   |                         |                                      |
| <i>ipv6-address/prefixlength</i> | Specifies the IPv6 destination address.  |                                  |                            |                                  |   |                         |                                      |
| <i>next-hop-address</i>          | Specifies the IPv6 next hop address.   |                                  |                            |                                  |   |                         |                                      |
| <b>Command Default</b>           | None.  |                                  |                            |                                  |   |                         |                                      |
| <b>Command Modes</b>             | Global configuration (config)  |                                  |                            |                                  |   |                         |                                      |

**Examples** The following example shows how to configure a static route using the **ipv6 route** command:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 route 2001:DB8:1::0/64 2001:DB8:0:ABCD::1
```

# no ipv6 neighbor

To delete neighbors from the ipv6 neighbors list, use the **no ipv6 neighbor** command in global configuration mode.

**no ipv6 neighbor { dynamic | static | all }**

|                           |   |   |
|---------------------------|---|---|
| <b>Syntax Description</b> | <b>dynamic</b><br><b>static</b><br><b>all</b> | Deletes the dynamic neighbors from the IPv6 neighbor list.<br>Deletes the static neighbors from the IPv6 neighbor list.<br>Deletes all the neighbors from the IPv6 neighbor list. |
| <b>Command Default</b>    | None.   |   |
| <b>Command Modes</b>      | Global configuration (config)                 |   |

The following example shows how to all the dynamic neighbors from the IPv6 neighbor list by using the **no ipv6 neighbor** command in the global configuration mode.

```
Device> enable
Device#configure terminal
Device(config)# no ipv6 neighbor dynamic
```

# mac-address-table

To add a MAC address manually to the MAC address table, use the **mac-address-table** command in the global configuration mode. To remove a MAC address from the table, use the **no** form of the command.

```
mac-address-table {static | permanent | dynamic} mac-address interface ethernet interface-number vlan
vlan-id
```

```
no mac-address-table {static | permanent | dynamic} mac-address interface ethernet interface-number
vlan vlan-id
```

## Syntax Description

**static** Adds a static MAC address to the MAC address table.

**permanent** Adds a MAC address permanently to the MAC address table.

**dynamic** Adds a dynamic MAC address to the MAC address table.

## Command Default

None

## Command Modes

Global configuration

## Examples

The following examples shows how to add a static MAC address to a MAC address table:

```
Device(config)# mac-address-table static 00:50:3e:8d:64:00 interface ethernet
1/4 vlan 3
```

# mac-address-table learning

To disable dynamic MAC address learning, use the **no mac-address-table learning** command. To disable MAC address learning on all ports use the command in the global configuration mode. To disable MAC address learning on specific ports use the command in the interface configuration mode. MAC address learning is enabled by default.

## mac-address-table learning

### no mac-address-table learning

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>learning</b> Enables or disables MAC address learning. |
|---------------------------|---|

|                        |   |
|------------------------|---|
| <b>Command Default</b> | MAC address learning is enabled by default. |
|------------------------|---|

|                      |   |
|----------------------|---|
| <b>Command Modes</b> | Global configuration<br>Interface configuration |
|----------------------|---|

|                 |  |
|-----------------|--|
| <b>Examples</b> | The following example shows how to disable MAC address learning on an ethernet port: |
|-----------------|--|

```
Device(config)# interface ethernet 1/4
Device(config-if-ethernet-1/4)# no mac-address-table learning
```

## mac-address-table age-time

To configure the aging time for entries in the MAC address table, use the **mac-address-table age-time** command in the global configuration mode. To disable the aging process use the **disable** keyword.

**mac-address-table age-time {seconds | disable}**

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>disable</b> Disables the ageing process for the MAC address table.<br><b>seconds</b> Configures the ageing time for the MAC address table in seconds. |
| <b>Command Default</b>    | None   |
| <b>Command Modes</b>      | Global configuration   |

**Examples** The following example shows how to configure ageing time for a MAC address table:

```
Device(config)# mac-address-table age-time 120
```

# mac-address-table blackhole

To add the MAC address of an untrusted user as a Blackhole MAC address, use the **mac-address-table blackhole** command in the global configuration mode. To remove a MAC address as a Blackhole MAC address use the **no** form of the command.

**mac-address-tableblackhole mac-address vlan vlan-id**

**no mac-address-tableblackhole mac-address vlan vlan-id**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>blackhole</b> Adds a MAC address as a Blackhole MAC address. |
|---------------------------|---|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                      |
|----------------------|----------------------|
| <b>Command Modes</b> | Global configuration |
|----------------------|----------------------|

|                 |  |
|-----------------|--|
| <b>Examples</b> | The following example shows how to add a MAC address as a Blackhole MAC address: |
|-----------------|--|

```
Device(config)# mac-address-table blackhole 00:05:00:05:00:05 vlan 1
```

**mac-address-table max-mac-count**

## mac-address-table max-mac-count

To configure the maximum number of MAC addresses that will be learnt by the MAC Address Table on a port, use the **mac-address-table max-mac-count** command in the interface configuration mode. To keep the number of MAC addresses learnt as unlimited use the **no** form of the command. By default, the number of MAC addresses that are dynamically learnt by the MAC Address Table are unlimited.

**mac-address-table max-mac-count *integer***

**no mac-address-table max-mac-count *integer***

---

### Syntax Description

**max-mac-count *integer*** Enables a limit on the number of dynamically learnt MAC addresses added to the table

---

### Command Default

The number of learnt MAC addresses are unlimited by default

### Command Modes

Interface configuration

### Examples

The following example shows how to enable a maximum learnt MAC address count on a port:

```
Device(config)# interface ethernet 1/4
Device(config-if-ethernet-1/4)# mac-address-table max-mac-count 500
```

# mirror destination-interface

To configure a port as destination port for mirroring, use the mirror destination-interface command in the global configuration mode. To remove the mirroring configuration, use the **no** form of the command.

[no] **mirror destination-interface** {**ethernet slot/port** | **gpon slot/port**}

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>ethernet slot/port</b> Specifies the ethernet interface that can be configured as the destination for port mirroring<br><b>gpon slot/port</b> Specifies the GPON interface as the destination for port mirroring.   |
| <b>Command Default</b>    | None   |
| <b>Command Modes</b>      | Global configuration (config)  |
| <b>Usage Guidelines</b>   | <p>Use this command to configure the destination port that receives the mirrored packets.</p> <p>Port mirroring duplicates the data packets on the monitored (source) port and sends the packets to a destination port for monitoring or analysis. You can mirror inbound packets or outbound packets or both types of packets on the source port.</p> <p>A port configured as a destination port cannot be used as a normal port.</p> <p>For a switch, you can configure only one port as destination port.</p> |

## Example

The following example sets the ethernet port 2/1 as the destination for mirroring.

```
Device#configure terminal
Device(config)#mirror source-interface ethernet 1/1 both

Device(config)#mirror destination-interface ethernet 2/1
```

# mirror source-interface

To configure a port to act as a source port for mirroring, use the **mirror source-interface** command in the global configuration mode. To remove the mirroring configuration, use the **no** form of the command.

[no] **mirror source-interface** {**ethernet slot/port** | **cpu** | **gpon slot/port**} {**ingress** | **egress** | **both**}

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <p><b>ethernet slot/port</b> Specifies the ethernet interface that can be configured as the source for port mirroring</p> <p><b>cpu</b> Specifies the CPU as the source for port mirroring</p> <p><b>gpon slot/port</b> Specifies the GPON interface as the source for port mirroring.</p> <p><b>ingress</b> Specifies that the packets at the ingress of the specified port, which are inbound, are mirrored.</p> <p><b>egress</b> Specifies that packets at the egress of the specified port, which are outbound, are mirrored.</p> <p><b>both</b> Specifies that the packets at both the ingress and egress interfaces are mirrored.</p> |
|---------------------------|---|

|                         |   |
|-------------------------|---|
| <b>Command Default</b>  | None  |
| <b>Command Modes</b>    | Global configuration (config)   |
| <b>Usage Guidelines</b> | <p>Use this command to configure the source port for mirroring the packets at the port. You can mirror inbound packets or outbound packets or both types of packets.</p> <p>Port mirroring duplicates the data packets on the monitored (source) port and sends the packets to a destination port for monitoring or analysis.</p> <p>You can configure multiple ports as source port for mirroring.</p> |

## Example

The following example sets the ethernet port 1/1 as the source for mirroring the packets.

```
Device#configure terminal
Device(config)#mirror source-interface ethernet 1/1 both
```

# show arp

To display the Address Resolution Protocol (ARP) table entries, use the **show arp** command in privileged or global configuration mode.

**show arp {dynamic | static | all }**

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>dynamic</b> Displays all the dynamic ARP table entries<br><b>static</b> Displays all the static ARP table entries<br><b>all</b> Displays all the entries from the ARP table |
| <b>Command Default</b>    | None   |
| <b>Command Modes</b>      | Privileged (#)<br>Global Configuration (config)  |
| <b>Usage Guidelines</b>   | The <b>show arp dynamic</b> command displays all mappings and information about each entry in the ARP table, including the aging time, VLAN instance, and port.                |

## Example

```
Device#show arp dynamic
Informations of ARP
d - days, h - hours, m - minutes, s - seconds
IpAddress      Mac_Address      Vlan  Port      VPTag  Type      ExpireTime   Status
10.75.171.1    00:23:5d:fd:94:00  100   e1/3     0      dynamic   18m34s     valid
10.75.171.71   00:50:56:92:1d:fb  100   e1/3     0      dynamic   10m51s     valid
10.75.171.79   00:0c:29:80:8b:59  100   e1/3     0      dynamic   17m43s     valid
10.75.171.91   00:0c:29:71:b1:4f  100   e1/3     0      dynamic   10m59s     valid
10.75.171.138  00:0c:29:f9:35:c3  100   e1/3     0      dynamic   11m07s     valid

Total entries:5
```

**Table 5: Description of the show arp dynamic Command Output**

|             |  |
|-------------|--|
| IPAddress   | Specifies the IP address of the ARP table entry          |
| MAC_Address | Specifies the MAC address associated with the IP address |
| Vlan        | Specifies the VLAN to which this interface belongs       |
| Port        | Specifies the port that has learnt the ARP entry         |
| VPTag       | Specifies the virtual port for GPON routing              |
| Type        | Specifies whether it is a dynamic or a static entry      |
| Expire Time | Displays the time remaining before the ARP entry expires |
| Status      | Specifies whether the entry is valid or not.             |

**show dhcp-snooping clients**

# show dhcp-snooping clients

To display binding between the IP address and the MAC address that is recorded by DHCP Snooping, use the **show dhcp-snooping clients** command in privileged or global configuration mode.

**show dhcp-snooping clients**

**Command Default** None

**Command Modes** Privileged (#)  
Global Configuration (config)

## Example

The following example shows a sample format of the output of this command:

```
Device#show dhcp-snooping clients
DHCP client information:
d - days, h - hours, m - minutes, s - seconds
IPAddress      mac          vlan   port     LeaseTime      ExceedTime
Total entries: 0. Printed entries: 0.
```

## Related Commands

| Command              | Description                          |
|----------------------|--------------------------------------|
| <b>dhcp-snooping</b> | Enables DHCP Snooping on the device. |

# show dhcp-snooping interface

To display the details of DHCP Snooping on an interface, use the **show dhcp-snooping interface** command in privileged or global configuration mode.

**show dhcp-snooping interface [ ethernet | gpon ] [ interface-id ]**

**Command Default** None

**Command Modes** Privileged (#)

Global Configuration (config)

**Usage Guidelines** This command displays the DHCP Snooping enabled state, information on the trusted port, the number of DHCP clients allowed on the physical port, and the number of currently connected DHCP clients.

## Example

```
Device#show dhcp-snooping interface
Config information of DHCP Snooping:
DHCP Snooping status:Enable
DHCP Snooping port-down-action fast-remove:Enable
Port information:
Port      mode      maxclients    clients(ack)   clients(unack)

```

# show dhcpv6-snooping vlan

To display the details of DHCPv6 Snooping on a VLAN, use the **show dhcpv6-snooping vlan** command in privileged or global configuration mode.

**show dhcpv6-snooping vlan *vlan\_id***

**Command Default** None

**Command Modes** Global Configuration (config)

**Usage Guidelines** This command displays the DHCPv6 Snooping enabled state, information on the trusted port, the number of DHCPv6 clients allowed on the physical port, and the number of currently connected DHCPv6 clients.

## Example

```
Device#show dhcpv6-snooping vlan 1
Config information of DHCPv6 Snooping:
DHCPv6 Snooping status:Enable
DHCPv6 Snooping port-down-action fast-remove:Enable
Port information:
Port      mode    maxclients   clients(ack)   clients(unack)
g0/1     untrust  2048          0              0
g0/2     untrust  2048          0              0
g0/3     untrust  2048          0              0
g0/4     untrust  2048          0              0
g0/5     untrust  2048          0              0
g0/6     untrust  2048          0              0
g0/7     untrust  2048          0              0
g0/8     untrust  2048          0              0
e1/1     untrust  2048          0              0
e1/2     untrust  2048          0              0
e1/3     untrust  2048          0              0
e1/4     untrust  2048          0              0
e2/1     untrust  2048          0              0
e2/2     untrust  2048          0              0
```

**show dlf-forward**

# show dlf-forward

To display the DLF forwarding configuration for a port, use the **show dlf-forward** command in the EXEC mode.

**show dlf-forward interface { ethernet port-number | gpon port-number }**

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>ethernet port-number</b> Displays the DLF Forwarding configuration for the ethernet port. |
|                           | <b>gpon port-number</b> Displays the DLF Forwarding configuration for the gpon port.         |

|                        |                              |
|------------------------|------------------------------|
| <b>Command Default</b> | None                         |
| <b>Command Modes</b>   | User EXEC<br>Privileged EXEC |

**Examples** The following example shows how to display the DLF forwarding configuration for an ethernet port

```
Device# show dlf-forward interface ethernet 1/1
Forwarding unknown unicast packets global status: disable
Forwarding unknown multicast packets global status: disable
Port      Forwarding Unknown Unicast      Forwarding Unknown Multicast
e1/1      disable                           disable
```

**Examples** The following example shows how to display the DLF forwarding configuration for a GPON port

```
Device# show dlf-forward interface gpon 0/1
Forwarding unknown unicast packets global status: disable
Forwarding unknown multicast packets global status: disable
Port      Forwarding Unknown Unicast      Forwarding Unknown Multicast
g0/1      disable                           disable
```

# show ip interface

To display the IP interface configuration for the Layer 3 device, use the **show ip interface** command in the EXEC mode.

**show ip interface {loopback-interface *loopback-interface-number* | vlan-interface *vlan-interface-number* | meth-interface *meth-interface-number*}**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <i>loopback-interface-number</i> Displays information for the loopback interface.<br><i>vlan-interface-number</i> Displays information for the VLAN interface.<br><i>meth-interface-number</i> Displays information for the meth interface. |
| <b>Command Default</b>    | None  |
| <b>Command Modes</b>      | User EXEC<br>Privileged EXEC  |

**Examples** The following example shows a sample output of a loopback interface:

```
Device# show ip interface loopback-interface 1
Show informations of interface
The mac-address of interface is 00:0a:5a:9b:18:15
Interface name      : LOOPBACK-IF1
Primary ipaddress   : None
Secondary ipaddress : None
Interface status     : Up
```

Total entries: 1 interface.

The following example shows a sample output of a VLAN interface:

```
Device# show ip interface vlan-interface 1
Show informations of interface
The mac-address of interface is 00:0a:5a:9b:18:15
Interface description : interface1
Interface name        : VLAN-IFI
Primary ipaddress     : None
Secondary ipaddress   : None
VLAN                  : 1
Address-range         : 192.0.2.254-192.0.2.255,
Interface status       : Up
```

Total entries: 1 interface.

**show ip source guard**

# show ip source guard

To display the status and port filter applied on each port, use the **show ip-source-guard** command in privileged or global configuration mode.

```
show ip-source-guard [bind | permit | vlan]
```

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>bind</b> Displays the entries of the static IP source binding table.<br><b>permit</b> Displays the whether Internet Group Management Protocol (IGMP) packets are permitted or not.<br><b>vlan ip ip-address</b> Displays VLAN information. |
| <b>Command Default</b>    | None  |
| <b>Command Modes</b>      | Privileged (#)<br>Global Configuration (config)   |

## Example

```
Device#show ip-source-guard
Port      Status   FilterType
g0/1     disable  N/A
g0/2     disable  N/A
g0/3     disable  N/A
g0/4     disable  N/A
g0/5     disable  N/A
g0/6     disable  N/A
g0/7     disable  N/A
g0/8     disable  N/A
e1/1     enable   ip+mac+vlan
e1/2     disable  N/A
e1/3     disable  N/A
e1/4     disable  N/A
e2/1     disable  N/A
e2/2     disable  N/A
```

Total entries:14

The following example displays the status of port filtering on IGMP packets:

```
Device#show ip-source-guard permit igmp
IP source guard permit igmp status:disable
```

| Related Commands | Command                | Description   |
|------------------|------------------------|---|
|                  | <b>ip-source-guard</b> | Configures the IP source guard function on the ports of the device. |

# show ipv6 interface

To display the IP interface configuration for the Layer 3 device, use the **show ipv6 interface** command in the EXEC mode.

```
show ipv6 interface { loopback-interface loopback-interface-number | vlan-interface vlan-interface-number | meth-interface meth-interface-number }
```

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <i>loopback-interface-number</i> Displays information for the loopback interface.<br><i>vlan-interface-number</i> Displays information for the VLAN interface.<br><i>meth-interface-number</i> Displays information for the meth interface. |
| <b>Command Default</b>    | None  |
| <b>Command Modes</b>      | User EXEC<br>Privileged EXEC  |

**Examples** The following example shows a sample output of a loopback interface:

```
Device# show ipv6 interface loopback-interface 1
Show informations of interface
The mac-address of interface is 00:0a:5a:9b:18:15
Interface name      : LOOPBACK-IF1
Primary ipaddress   : None
Secondary ipaddress : None
Interface status     : Up
```

Total entries: 1 interface.

The following example shows a sample output of a VLAN interface:

```
Device# show ipv6 interface vlan-interface 1
Show informations of interface
The mac-address of interface is 00:0a:5a:9b:18:15
Interface description : interface1
Interface name        : VLAN-IF1
Primary ipaddress     : None
Secondary ipaddress   : None
VLAN                  : 1
Address-range         : 192.0.2.254-192.0.2.255,
Interface status       : Up
```

Total entries: 1 interface.

**show ipv6 nd dad attempts**

## show ipv6 nd dad attempts

To display the number of times Neighbor Solicitation (NS) messages are being sent for duplicate address detection, use the **show ipv6 nd dad attempts** command in EXEC mode.

**show ipv6 nd dad attempts**

| Syntax Description     | attempts                  | Displays the number of times NS messages are being sent for duplicate address detection. |
|------------------------|---------------------------|--|
| <b>Command Default</b> | None                      |  |
| <b>Command Modes</b>   | User EXEC Priveleged EXEC |  |

The following example shows a sample output of the **show ipv6 nd dad attempts** command.

```
Device#show ipv6 nd dad attempts
Global duplicate address detection times configuration is: 1
Interface specific configurations are as follows:
Interface : DAD times

Total entries:0
```

# show ipv6 nd ns retrans-time

To display the interval at which the Neighbor Solicitation (NS) messages are being sent for duplicate address detection, use the **show ipv6 nd ns retrans-time** command in EXEC mode.

**show ipv6 nd ns retrans-time**

|                           |                           |  |
|---------------------------|---------------------------|--|
| <b>Syntax Description</b> | <b>retrans-time</b>       | Displays the interval at which the NS messages are being sent for duplicate address detection. |
| <b>Command Default</b>    | None                      |  |
| <b>Command Modes</b>      | User EXEC Privileged EXEC |  |

The following example shows a sample output of the **show ipv6 nd ns retrans-time** command.

```
Device#show ipv6 nd ns retrans-time
Global neighbor solicitation retransmit time configuration is: 1 s
Interface specific configurations are as follows:
Interface : Retransmit time(s)

Total entries:0
```

show ipv6 nd reachable-time

## show ipv6 nd reachable-time

To display the reachable time configured on an interface, use the **show ipv6 nd reachable-time** command in EXEC mode. Reachable time is the time for which a neighbor is considered to be in a reachable state.

**show ipv6 nd reachable-time**

|                           |                           |   |
|---------------------------|---------------------------|---|
| <b>Syntax Description</b> | <b>reachable-time</b>     | Displays the reachable time configured on an interface. |
| <b>Command Default</b>    | None.                     |   |
| <b>Command Modes</b>      | User EXEC Priveleged EXEC |   |

The following example displays a sample output for the **show ipv6 nd reachable-time** command.

```
Device#show ipv6 nd reachable-time
Global reachable time configuration is: 30 s
Interface specific configurations are as follows:
Interface : Reachable time(s)
```

# show ipv6 neighbors

To display the list of IPv6 neighbors for an interface, use the **show ipv6 neighbors** command in the EXEC mode.

```
show ipv6 neighbors { ipv6-address | all | dynamic | static | mac mac-address | max-learning-num }
```

## Syntax Description

|                         |   |
|-------------------------|---|
| <i>ipv6-address</i>     | Specifies the IPv6 address of the neighbor.                                 |
| <b>all</b>              | Displays a list of all the IPv6 neighbors.                                  |
| <b>dynamic</b>          | Displays a list of all the dynamic IPv6 neighbors.                          |
| <b>static</b>           | Displays a list of all the static IPv6 neighbors.                           |
| <b>mac</b>              | Displays the MAC address of all the IPv6 neighbors.                         |
| <b>max-learning-num</b> | Displays the maximum number of neighbors the interface is allowed to learn. |

## Command Default

None.

## Command Modes

User EXEC Privileged EXEC

**show ipv6 route**

# show ipv6 route

To display the IPv6 static route configuration, use the **show ipv6 route** command in the EXEC mode.

**show ipv6 route [ ospf ]**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <i>ospf</i> Displays information of the OSPF routing configuration. |
| <b>Command Default</b>    | None.   |
| <b>Command Modes</b>      | User EXEC<br>Privileged EXEC  |

## Examples

The following example shows a sample output of the **show ipv6 route** command:

```
Device# show ipv6 route
Show ip route information

INET6 route table - vr: 0, table: 254
Route flag: U - up, G - gateway, H - host, R - reject, C - clone, S - static
Destination          Gateway          Flags    Use   Interface

Total entries: 8. Printed entries: 8.
```

# show mac-address-table age-time

To display the aging time of the MAC address table, use the **show mac-address-table age-time** command in the EXEC mode.

## show mac-address-table age-time

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>age-time</b> Displays the aging time of the MAC address table. |
|---------------------------|---|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                              |
|----------------------|------------------------------|
| <b>Command Modes</b> | User EXEC<br>Privileged EXEC |
|----------------------|------------------------------|

|                 |  |
|-----------------|--|
| <b>Examples</b> | The following example shows how to display the aging time for a MAC address table: |
|-----------------|--|

```
Device# show mac-address-table age-time
mac address table agingtime is 300 seconds.
```

**show mac-address-table**

# show mac-address-table

To display information about the MAC address table, use the **show mac-address-table** command in the EXEC mode.

```
show mac-address-table {static | permanent | dynamic} blackhole learning interface
ethernetinterface-number vlan vlan-id
```

## Syntax Description

**static** Displays the static MAC address table.

**permanent** Displays the permanent entries in the MAC address table.

**dynamic** Displays the dynamic MAC address table.

**blackhole** Displays the blackhole MAC address table.

**learning** Displays the MAC address learning status.

## Command Default

None

## Command Modes

User EXEC  
Privileged EXEC

## Examples

The following example shows how to display the dynamic MAC address table:

```
Device# show mac-address-table dynamic
Show ARL table information
MAC Address      VLAN ID  port   status
00:0a:5a:a7:01:34  100     g0/1   dynamic
00:0b:ab:82:2d:82  100     e1/3   dynamic
00:0c:29:07:b6:9b  100     e1/3   dynamic

e4:1f:13:77:a0:c8 100      e1/3  dynamic
Total entries: 43 .
```

## Examples

The following example shows how to display the static MAC address table:

```
Device# show mac-address-table static
Show ARL table information
MAC Address      VLAN ID  port   status
00:0a:5a:9b:18:15 1        cpu    static
00:0a:5a:9b:18:15 100     cpu    static
Total entries: 2 .
```

## Examples

The following example shows how to display the MAC address table learning status:

```
Device# show mac-address-table learning interface ethernet 1/1
Port          Mac learning status
e1/1          enable
Total entries: 1 .
```

**show mirror**

## show mirror

To see the port mirror configuration, use the **show mirror** command in privileged or global configuration mode.

```
show mirror
```

---

**Command Default** None

---

**Command Modes** Privileged (#)  
Global Configuration (config)

### Example

```
Device#show mirror
Information about mirror port(s)
The monitor port      : e1/4
The mirrored egress ports   : cpu,e1/1-e1/2.
The mirrored ingress ports : cpu,e1/1-e1/2.
```

# show snmp community

To display the SNMP community strings configured on the switch, use the **show snmp community** command in privileged or global configuration mode.

```
show snmp community
```

**Command Default** None

**Command Modes** Privileged (#)

Global Configuration (config)

## Example

```
Device#show snmp community
Show snmp community information
Encryption status: OFF
index   community   priority   state   view-name
1       public      ro         permit   iso
2       private     rw         permit   iso
```

## Related Commands

| Command                          | Description                    |
|----------------------------------|--------------------------------|
| <b>snmp-server<br/>community</b> | Sets the SNMP community string |

**show snmp contact**

## show snmp contact

To display the SNMP contact string, use the **show snmp contact** command in privileged or global configuration mode.

```
show snmp contact
```

**Command Default** None

**Command Modes** Privileged (#)  
Global Configuration (config)

### Example

```
Device#show snmp contact
Manager contact information : http://
```

| Related Commands | Command                    | Description                               |
|------------------|----------------------------|---|
|                  | <b>snmp-server contact</b> | Sets the SNMP manager contact information |

# show snmp engineid

To display the identification of the local SNMP engine and all remote engines that have been configured on the device, use the **show snmp engineid** command in privileged or global configuration mode.

```
show snmp engineid {local | remote } [engineid]
```

**Command Default** None

**Command Modes** Privileged (#)

Global Configuration (config)

## Example

The following is a sample output of the **show snmp engineid local** command

```
Device#show snmp engineid local
Local engine id: : 13464000000000000000000000000000
```

| Related Commands | Command                     | Description                         |
|------------------|-----------------------------|-------------------------------------|
|                  | <b>snmp-server engineid</b> | Configures engine ID on the device. |

**show snmp group**

# show snmp group

To display the different SNMP group configurations, use the **show snmp group** command in privileged or global configuration mode.

```
show snmp group
```

**Command Default** None

**Command Modes** Privileged (#)  
Global Configuration (config)

**Usage Guidelines** Use this command to view the names of configured SNMP groups, the security models being used, and the different views configured under each group.

## Example

```
Device#show snmp group
groupname: g3
securitymodel: 3 auth
readview: iso
writeview: iso
notifyview: no specified notifyview
context: default value(NULL)

groupname: initial
securitymodel: 3 noauthpriv
readview: iso
writeview: iso
notifyview: iso
context: default value(NULL)

groupname: initial
securitymodel: 3 auth
readview: iso
writeview: iso
notifyview: iso
context: default value(NULL)

group snmp3 number:3
```

## Related Commands

| Command                  | Description              |
|--------------------------|--------------------------|
| <b>snmp-server group</b> | Configures an SNMP group |

# show snmp host

To display the recipient details for the SNMP trap notifications, use the **show snmp host** command in privileged or global configuration mode.

```
show snmp host
```

**Command Default** None

**Command Modes** Privileged (#)

Global Configuration (config)

## Example

```
Device#show snmp host
Show SNMP trap host information
SNMP host ip security version
10.75.166.19 public 2c
```

## Related Commands

| Command                 | Description  |
|-------------------------|--|
| <b>snmp-server host</b> | Configures the recipient for the SNMP notifications. |

**show snmp location**

## show snmp location

To display the SNMP manager location string, use the **show snmp location** command in privileged or global configuration mode.

```
show snmp location
```

**Command Default** None

**Command Modes** Privileged (#)  
Global Configuration (config)

### Example

```
Device#show snmp location
Switch location information : sample sysLocation factory default
```

| Related Commands | Command                     | Description                            |
|------------------|-----------------------------|--|
|                  | <b>snmp-server location</b> | Sets the SNMP manager location string. |

# show snmp mib

To display the Management Information Base (MIB) module instance identifiers, use the **show snmp mib** command in privileged or global configuration mode.

```
show snmp mib [module module-name]
```

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>module</b> <i>module-name</i> Specifies the MIB module object instance identifier  |
| <b>Command Default</b>    | None  |
| <b>Command Modes</b>      | Privileged (#)<br>Global Configuration (config)   |
| <b>Usage Guidelines</b>   | SNMP MIB is a repository for information about device parameters and network data. Collections of related objects are defined in MIB modules.<br><br>The <b>show snmp mib</b> command displays the instance identifiers for all the MIB objects on the system. The MIB module table names are registered when the system initializes. |

**Note** The **show snmp mib** command generates a high volume of output if SNMP is enabled on your system.

## Example

The following is a sample output that shows the details of the **gbnL2PppoePlus** MIB module:

```
Device#show snmp mib module gbnL2PppoePlus
gbnL2PppoePlus:pppoeplusType-[1.3.6.1.4.1.9.6.1.120.1.2.4.6.2.0]
gbnL2PppoePlus:pppoeplusFormat-[1.3.6.1.4.1.9.6.1.120.1.2.4.6.3.0]

```

**show snmp name**

## show snmp name

To display the SNMP system name, use the **show snmp name** command in privileged or global configuration mode.

```
show snmp name
```

**Command Default** None

**Command Modes** Privileged (#)  
Global Configuration (config)

### Example

```
Device#show snmp name
system name : 2
```

**Related Commands**

| Command                 | Description                |
|-------------------------|----------------------------|
| <b>snmp-server name</b> | Sets the SNMP system name. |

# show snmp notify

To display the configured SNMP notifications on the system, use the **show snmp notify** command in privileged or global configuration mode.

```
show snmp notify
```

**Command Default** None

**Command Modes** Privileged (#)

Global Configuration (config)

## Example

```
Device#show snmp notify
Name      Type  State
bridge    trap  enabled
gbn      trap  enabled
gbnsavecfg trap  enabled
interfaces trap  enabled
rmon     trap  enabled
snmp     trap  enabled
if-ethernet   Link-Trap
g0/1      enabled
g0/2      enabled
g0/3      enabled
g0/4      enabled
g0/5      enabled
g0/6      enabled
g0/7      enabled
g0/8      enabled
e1/1      enabled
e1/2      enabled
e1/3      enabled
e1/4      enabled
e2/1      enabled
e2/2      enabled
```

## Related Commands

| Command                        | Description   |
|--------------------------------|---|
| <b>snmp-server trap-source</b> | Configures an interface that originates SNMP traps. |
| <b>snmp-server enable</b>      | Enables SNMP notifications                          |

**show snmp user**

## show snmp user

To display information about the configured SNMP users, use the **show snmp user** command in privileged or global configuration mode.

```
show snmp user
```

**Command Default** None

**Command Modes** Privileged (#)  
Global Configuration (config)

### Example

```
Device#show snmp user
User name: u3
Engine ID: 13464000000000000000000000000000
Authentication Protocol: HMACMD5AuthProtocol
Group-name: g3
Validation: valid

User name: initialmd5
Engine ID: 13464000000000000000000000000000
Authentication Protocol: HMACMD5AuthProtocol
Group-name: initial
Validation: valid

User name: initialsha
Engine ID: 13464000000000000000000000000000
Authentication Protocol: HMACSHAAuthProtocol
Group-name: initial
Validation: valid

User name: initialnone
Engine ID: 13464000000000000000000000000000
Authentication Protocol: NoauthProtocol
Group-name: initial
Validation: valid

user number:4
```

### Related Commands

|------------------|-------------------------|-------------------------|
|                  | <b>snmp-server view</b> | Configures an SNMP view |

**shutdown**

# shutdown

To shut down a VLAN interface, use the **shutdown** command in the VLAN configuration mode. You can cancel the shutdown of the VLAN interface by using the **no** form of the command.

**shutdown****no shutdown**

---

**Syntax Description****shutdown** Shuts down the VLAN interface.

---

**Command Default**

None

---

**Command Modes**

VLAN configuration

---

**Examples**

The following example shows how to shut down a VLAN interface:

```
Device(config-if-vlanif)# shutdown
```

# snmp-server

To enable or disable Simple Network Management Protocol (SNMP) on a device use the **snmp-server** command in the global configuration mode.

```
snmp-server {enable [informs | traps] [bridge | gbn | gbnsavecfg | interfaces | rmon | snmp] | disable}
```

## Syntax Description

**enable** Enables SNMP traps on the device

**disable** Disables the SNMP server

**informs** Configures SNMP inform request

**traps** Configures SNMP trap notifications

- **bridge** Specifies the type of SNMP informs or traps notifications to be enabled.
- **gbn** If you do not specify the type of SNMP inform or trap, all traps and informs that are configured on your system are enabled.
- **gbnadv**
- **interfaces**
- **rmon**
- **snmp**

## Command Default

None

## Command Modes

Global configuration (config)

## Usage Guidelines

The **snmp-server enable** command is optional. SNMP traps and informs are enabled by default, on the device. Use the **snmp-server disable** command to disable SNMP traps or informs on the device.

## Example

```
Device#configure terminal
Device(config)#snmp-server enable traps gbn
```

**snmp-server community**

## snmp-server community

To set up the community access string to permit access to the Simple Network Management Protocol (SNMP) use the **snmp-server community** command in the global configuration mode. To remove the configured community string, use the **no** form of the command.

```
[no] snmp-server community {name|md5} {ro|rw}{deny|permit} [view view-name]
```

|                                  |  |
|----------------------------------|--|
| <b>Syntax Description</b>        |  |
| <b>name</b>                      | SNMP community name that consists of 1 to 32 characters  |
| <b>md5</b>                       | Uses md5 for authentication  |
| <b>ro</b>                        | Specifies read-only access. Authorized management stations can retrieve only MIB objects   |
| <b>rw</b>                        | Specifies read-write access. Authorized management stations can both retrieve and modify MIB objects.  |
| <b>permit</b>                    | Specifies community name string is active  |
| <b>deny</b>                      | Specifies community name string is not activated   |
| <b>view<br/><i>view-name</i></b> | (Optional) Specifies a previously defined view. The view defines the objects available to the SNMP community.<br>Default view is ISO.  |
| <b>Command Default</b>           | None   |
| <b>Command Modes</b>             | Global configuration (config)  |
| <b>Usage Guidelines</b>          | The SNMP community name authenticates access to MIB objects. In order for the NMS to access the switch, the community name definitions on the NMS must match at least one of the community name definitions on the switch. |

### Examples

The following example shows how to set the read/write community string to group1:

```
Device#configure terminal
Device(config)#snmp-server community group1 rw permit
```

The following example shows how to assign the string manager to SNMP and allow read-only access to the objects in the view called restricted:

```
Device(config)#snmp-server community group1 ro permit view restricted
```

The following example shows how to remove the community 1:

```
Device(config)#no snmp-server community 1
```

# snmp-server community encrypt

To enable or disable encryption of community access string, use the **snmp-server community encrypt** command in the global configuration mode.

```
snmp-server community encrypt {enable|disable}
```

## Syntax Description

**enable** Enables encryption of the community name string

**disable** Disables encryption of community name string

## Command Default

The community name string is not encrypted.

## Command Modes

Global configuration (config)

## Example

```
Device#configure terminal  
Device(config)#snmp-server community encrypt enable
```

## snmp-server contact

To configure the SNMP manager contact information, use the **snmp-server contact** command in the global configuration mode. To remove the SNMP manager contact information, use the **no** form of the command.

```
snmp-server contact contact-information
```

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <i>contact-information</i> Specifies the SNMP manager contact details |
| <b>Command Default</b>    | SNMP manager contact string is not set.                               |
| <b>Command Modes</b>      | Global Configuration (config)   |

### Example

```
Device(config)#snmp-server contact SystemOperator
```

# snmp-server encrypt

To enable or disable the encryption of the password for a user, use the **snmp-server encrypt** command in the global configuration mode.

A password is encrypted by default.

```
snmp-server encrypt {enable|disable}
```

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>enable</b> Enables the encryption of password<br><b>disable</b> Disables the encryption of password |
| <b>Command Default</b>    | None   |
| <b>Command Modes</b>      | Global configuration (config)  |

## Example

```
Device#configure terminal
Device(config)#snmp-server encrypt disable
```

**snmp-server engineid**

# snmp-server engineid

To configure the Simple Network Management Protocol (SNMP) engine ID on a local device or a remote device, use the **snmp-server** command in the global configuration mode.

```
snmp-server engineid [local | remote ip-address [udp-port] port-num] engineid
```

## Syntax Description

|                                 |   |
|---------------------------------|---|
| <b>local</b> <i>engineid</i>    | Specifies the engine ID of the local device |
| <b>remote</b> <i>ip-address</i> | Specifies the engine ID of the local device |
| <b>udp-port</b> <i>port-num</i> | Specifies the UDP port on the remote device |

## Command Default

None

## Command Modes

Global configuration (config)

## Usage Guidelines

An SNMP engine ID is a unique string that identifies the device, for administrative purposes.

The engine ID of the local SNMP device is 13464000000000000000000000000000. You can modify the local engine ID, but not delete it. You can create and delete the engine ID of a remote SNMP device. If you delete a remote engine ID, the corresponding users are also deleted. You can configure a maximum number of 32 remote engine IDs.

## Example

```
Device#configure terminal
Device(config)#snmp-server engineid remote 172.16.20.4 1
```

# snmp-server group

To configure an SNMP group that enables authentication for the members of a specified view, use the **snmp-server group** command in the global configuration mode. To remove the configured authentication for the SNMP group, use the **no** form of the command.

```
[no] snmp-server group group-name [auth |noauthpriv |priv] read read-view  
write write-view notify notify-view
```

| Syntax Description               |   |
|----------------------------------|---|
| <b>auth</b>                      | Specifies that packets are authenticated but not encrypted.   |
| <b>noauthpriv</b>                | Specifies that packets are not authenticated.   |
| <b>priv</b>                      | Specifies that packets are authenticated and not encrypted.   |
| <b>read <i>read-view</i></b>     | (Optional) Specifies a read view for the SNMP group. This view enables you to view only the contents of the agent.<br><br>If a <i>read-view</i> is not specified, it defaults to the iso view and auth security level.                                  |
| <b>write <i>write-view</i></b>   | (Optional) Specifies a write view for the SNMP group. This view enables you to enter data and configure the contents of the agent.<br><br><b>write-view</b> does not have defaults. Hence it is mandatory to specify it if <b>write</b> is configured.  |
| <b>notify <i>notify-view</i></b> | (Optional) Specifies a notify view for the SNMP group. This view enables you to specify a notification or a trap.<br><br><b>notify-view</b> does not have defaults. Hence it is mandatory to specify <i>notify-view</i> if <b>notify</b> is configured. |
| <b>Command Default</b>           | None  |
| <b>Command Modes</b>             | Global configuration (config)   |

## Examples

```
Device#configure terminal  
Device(config)#snmp-server group g1 3 priv write dept-view
```

## snmp-server host

To configure the recipient of an SNMP notification operation, use the **snmp-server host** command in the global configuration mode. To remove the configured recipient for the SNMP group, use the **no** form of the command.

```
[no] snmp-server host {inet6 ipv6-address | ipv4-address} {version {1 | 2c | 3{auth | noauthpriv | priv}}} {security-name [udp-port udp-port-num] [ notify-type[bridge | gbn | gbnsavecfg | interfaces | rmon | snmp] ]}
```

| Syntax Description      | <b>inet6 <i>ipv6-address</i></b>   | Specifies the IPv6 address of the recipient of SNMP traps  |
|-------------------------|--|--|
|                         | <b><i>ipv4-address</i></b>   | Specifies the IPv4 address of the recipient of SNMP traps  |
|                         | <b>version {1   2c   3{auth   noauthpriv   priv}}</b>  | <p>Specifies the SNMP version: 1, 2c, 3.</p> <p>If you specify SNMP version 3, ensure that you specify the security levels too:</p> <ul style="list-style-type: none"> <li>• <b>auth</b>: Enables MD5 and SHA packet authentication</li> <li>• <b>noauth</b>: Specifies that the noAuthNoPriv security level applies to this host. This is the default security level for SNMPv3.</li> <li>• <b>priv</b>: Enables Data Encryption Standard (DES) packet encryption.</li> </ul> |
|                         | <b><i>security-name</i></b>  | Defines a name for this configuration.   |
|                         | <b>udp-port <i>udp-port-num</i></b>  | Specifies the UDP port on the host device.   |
|                         | <b>notify-type</b>   | <p>Specifies the type of notification to be sent to the host:</p> <ul style="list-style-type: none"> <li>• bridge</li> <li>• gbn</li> <li>• gbnsavecfg</li> <li>• interfaces</li> <li>• rmon</li> <li>• snmp</li> </ul>  |
| <b>Command Default</b>  | None   |  |
| <b>Command Modes</b>    | Global configuration (config)  |  |
| <b>Usage Guidelines</b> | <p>Use the <b>snmp-server host</b> command to configure a recipient for the SNMP notifications. If this command is not configured, no notifications are sent. <b>snmp-server host</b> command is used in conjunction with the <b>snmp-server enable</b> command. For a host to receive most notifications, at least one <b>snmp-server enable</b> command and the <b>snmp-server host</b> command for that host must be enabled.</p> |  |

## Examples

```
Device#configure terminal  
Device(config)#snmp-server host 192.168.5.1 version 2c test-sec udp-port 4
```

## snmp-server location

To set the SNMP server location string, use the **snmp-server location** command in the global configuration mode. To remove the SNMP server location information, use the **no** form of the command.

```
[no] snmp-server location syslocation
```

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <i>syslocation</i> String that describes the SNMP server location |
|---------------------------|---|

|                        |                                   |
|------------------------|-----------------------------------|
| <b>Command Default</b> | No system location string is set. |
|------------------------|-----------------------------------|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global Configuration (config) |
|----------------------|-------------------------------|

### Example

```
Device(config)#snmp-server location Building13
```

# snmp-server max-packet-length

To configure the maximum size of SNMP packets, use the **snmp-server max-packet-length** command in the global configuration mode. To remove the maximum packet length configuration for SNMP packets, use the **no** form of the command.

```
[no] snmp-server max-packet-length length
```

## Syntax Description

*length* Specifies the maximum packet length for SNMP packets. The value ranges from 484 bytes through 8000 bytes.

Default value is 1000 bytes.

## Command Default

Maximum packet length is set to 1000 bytes.

## Command Modes

Global Configuration (config)

## Example

```
Device(config)#snmp-server max-packet-length 1200
```

**snmp-server name**

## snmp-server name

To set the SNMP system name string, use the **snmp-server name** command in the global configuration mode. To remove the SNMP server name information, use the **no** form of the command.

```
[no] snmp-server name sysname
```

**Syntax Description** *sysname* String that describes the SNMP server name

**Command Default** No system name string is set.

**Command Modes** Global Configuration (config)

### Example

```
Device(config)#snmp-server name Building13Server
```

## snmp-server trap-source

To specify the interface from which the Simple Network Management Protocol (SNMP) trap should originate, use the **snmp-server trap-source** command in the global configuration mode. To remove the source of SNMP trap, use the **no** form of the command.

```
snmp-server trap-source {inet6 | vlan-interface vlan-id | loopback-interface interface | vlan-interface vlan-id}
```

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>inet6</b> Specifies the IPv6 address family<br><b>vlan-interface <i>vlan-id</i></b> Specifies the VLAN id to which the VLAN interfaces that originate the traps, belong.<br><b>loopback-interface <i>interface</i></b> Specifies the loopback interface that is configured as the origin of the traps. |
| <b>Command Default</b>    | None  |
| <b>Command Modes</b>      | Global configuration (config)   |
| <b>Usage Guidelines</b>   | <p>Use this command to monitor notifications from a particular interface.</p> <p>An SNMP trap or inform that is sent from an SNMP server has a notification address of the interface it went out of at that time.</p>   |

### Example

```
Device#configure terminal
Device(config)#snmp-server trap-source vlan-interface 3
```

## snmp-server user

To configure a new user to an SNMP group, use the **snmp-server user** command in the global configuration mode. To remove a configured user from an SNMP group, use the **no** form of this command.

```
[no] snmp-server user username group-name [remote ipaddress [udp-port port-number] ] [auth {md5 |sha }{auth-password {authpassword |encrypt-authpassword password} |auth-key{authkey | encrypt-authkeypassword}} ][privdes {priv-key{key | encrypt-privkeykey} | priv-password{password | encrypt-privpasswordprivpassword}} ] ]
```

|  |   |
|--|---|
| <b>Syntax Description</b>                |   |
| <i>username</i>                          | Name of the user created  |
| <i>group-name</i>                        | Name of the SNMP group to which the user belongs  |
| <b>remote</b>                            | (Optional) A remote SNMP entity to which the user belongs   |
| <i>ipaddress</i>                         | (Optional) IP address of the remote SNMP host.  |
| <b>udp-port</b> <i>port-number</i>       | (Optional) UDP port on the remote port  |
| <b>auth</b>                              | (Optional) Specifies which authentication level should be used.   |
| <b>md5</b>                               | (Optional) Specifies the HMAC-MD5-96 authentication level   |
| <b>sha</b>                               | (Optional) Specifies the HMAC-SHA-96 authentication level   |
| <b>auth-password</b> <i>authpassword</i> | Specifies the authentication password   |
| <b>auth-key</b> <i>authkey</i>           | Specifies the authentication key  |
| <b>priv</b>                              | (Optional) Specifies the use of the User-based Security Model (USM) for SNMP version 3 for SNMP message level security.   |
| <b>des</b>                               | (Optional) Specifies the use of the 56-bit Digital Encryption Standard (DES) algorithm for encryption.  |
| <b>priv-key</b>                          | (Optional) String that specifies the privacy user password.   |
| <b>Command Default</b>                   | None  |
| <b>Command Modes</b>                     | Global configuration (config)   |
| <b>Usage Guidelines</b>                  | <p>The <b>snmp-server user</b> command configures a user for a local engine or a remote engine. The following three users exist by default and they are reserved as the system users:</p> <ul style="list-style-type: none"> <li>• initialmd5</li> <li>• initialsha</li> <li>• initialnone</li> </ul> |

To configure a remote engine user, specify remote ipaddress. If you do not specify remote ipaddress, a local engine user is configured.

For a remote user, the default port number is 162. To configure a different remote port, specify a udp-port port-number .

Three levels of user privileges can be specified:

- **noauthpriv** : Authentication and password encryption are not required. It is the default configuration.
- **auth**: Authentication is required but password encryption is not required.
- **authpriv**: Authentication and password encryption, both are required.

---

**Note** The user security level should be the same as the corresponding group security level.

---

### Example

```
Device#configure terminal
Device(config)#snmp-server user u3 g3 auth md5 auth-password password1
```

## snmp-server view

To create or update an SNMP server view, use the **snmp-server view** command in the global configuration mode. To remove the configured SNMP server view, use the **no** form of the command.

```
[no] snmp-server view view-name oid-subtree {include | exclude}
```

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <p><i>oid-subtree</i> Object identifier (OID) of the ASN.1 subtree that is either included or excluded from the view.<br/>A string that can have up to 64 characters.</p> <p><i>view-name</i> Name of the SNMP view that is to be created.</p> <p><b>exclude</b> Excludes the OID specified in the <i>oid-subtree</i> argument from the SNMP view.</p> <p><b>include</b> Includes the OID specified in the <i>oid-subtree</i> argument in the SNMP view.</p> |
| <b>Command Default</b>    | None   |
| <b>Command Modes</b>      | Global configuration (config)  |
| <b>Usage Guidelines</b>   | Use this command to create a view that is a list of SNMP object trees, which you can access. The <b>iso</b> , <b>internet</b> and <b>sysview</b> views exist by default. You cannot delete or modify the <b>internet</b> view.   |

### Examples

The following example creates a view named **oneview** and excludes all objects of the subtree:

```
Device#configure terminal
Device(config)#snmp-server view oneview 1.3 exclude
```

PART VI

**bandwidth egress rate**

## bandwidth egress rate

To set the bandwidth limit on the outbound traffic on a port, use the **bandwidth egress rate** command in the interface configuration mode. To remove the configured bandwidth limit, use the **no** form of the command.

```
[no]bandwidth egress target-rate [ target-burst-rate ]
```

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <p><i>target-rate</i></p> <p>Specifies the bandwidth limit in Kbps.<br/>The target rate must be a multiple of 64K and should range between 2048 and 2608832 Kbps:<br/>It should be 2048 to 1024000 Kbps for a GE port, 2048 to 2608832 Kbps for a PON port, and 2048 to 10240000 for a 10GE port.</p> |
|                           | <p><i>target-burst-rate</i></p> <p>Specifies the burst transmission rate.<br/>Target burst rate (Kbps) must be a multiple of 64K<br/>Values can range between 2048 through 2608832.</p>   |

|                        |                                     |
|------------------------|-------------------------------------|
| <b>Command Default</b> | None                                |
| <b>Command Modes</b>   | Interface Configuration (config-if) |

### Example

```
Device#configure terminal
Device(config)#interface e1/1

Device(config-if-ethernet-1/1)#bandwidth egress 2048
```

# clear traffic-statistic

To remove the traffic statistics records, use the **clear traffic-statistic** command in the global configuration mode.

```
clear traffic-statistic { [all | [ip-group {num | name} [subitem subitem] ] [link-group {num | name} [subitem subitem] ] ] }
```

|                                |                                       |
|--------------------------------|---------------------------------------|
| <b>ip-group {num   name}</b>   | Specifies a standard or extended ACL. |
| <b>link-group {num   name}</b> | Specifies a Layer 2 ACL.              |
| <b>subitem subitem</b>         | Specifies the sub item in the ACL.    |

**Command Modes** Global Configuration (config)

**Command Default** None

**Usage Guidelines** Use the **clear traffic-statistic all** command to remove all traffic statistics records.

Use the **clear traffic-statistic ip-group** or **clear traffic-statistic link-group** command to remove the traffic statistics records that are generated for the specified access control list.

## Example

```
Device#configure terminal
Device(config)#clear traffic-statistic ip-group 3
```

# queue-scheduler cos-map

To map the 802.1p priorities to the hardware queue, use the **queue-scheduler cos-map** command in the global configuration mode. To restore the default queue scheduler settings, use the **no** form of the command.

[no] **queue-scheduler cos-map [queue-class] [priority]**

|                           |  |                    |   |                 |  |
|---------------------------|--|--------------------|---|-----------------|--|
| <b>Syntax Description</b> | <table border="0"> <tr> <td><i>queue-class</i></td><td>Specifies the hardware queue value which ranges from 0 through 7.</td></tr> <tr> <td><i>priority</i></td><td>Specifies the 802.1p priority. The value ranges from 0 to 7.</td></tr> </table>  | <i>queue-class</i> | Specifies the hardware queue value which ranges from 0 through 7. | <i>priority</i> | Specifies the 802.1p priority. The value ranges from 0 to 7. |
| <i>queue-class</i>        | Specifies the hardware queue value which ranges from 0 through 7.  |                    |   |                 |  |
| <i>priority</i>           | Specifies the 802.1p priority. The value ranges from 0 to 7.   |                    |   |                 |  |
| <b>Command Default</b>    | Strict Priority scheduling is followed by default.   |                    |   |                 |  |
| <b>Command Modes</b>      | Global configuration (config)  |                    |   |                 |  |
| <b>Usage Guidelines</b>   | <p>802.1p is used to classify the outgoing traffic at the egress port based on the 802.1p priority. For each message that enters the switch, the system maps the specific hardware queue priority according to the 802.1p priority of the message.</p> <p>Changing the mapping relation between 802.1p priority and hardware queues changes the mapping relation between 802.1p priorities and output queues.</p> <p>If two 802.1p priorities are mapped to the same hardware priority queue, messages of the two 802.1p priorities cannot be forwarded with 1:1 forwarding.</p> <p>Use the <b>queue-scheduler cos-map</b> command to set the 802.1p mapping with hardware queue priority.</p> |                    |   |                 |  |

## Example

The following example shows how to map packets with priority 0 to queue 1:

```
Device#configure terminal
Device(config)#queue-scheduler cos-map 1 0
Config successfully.
```

# queue-scheduler strict-priority

To configure the strict priority queue scheduling algorithm on the queue scheduler, use the **queue-scheduler strict-priority** command in the global configuration mode. To restore the default queue scheduler settings, use the **no** form of the command.

```
[no ]queue-scheduler strict-priority
```

**Command Default** Strict Priority scheduling is followed by default.

**Command Modes** Global configuration (config)

**Usage Guidelines** Strict-Priority Queuing is designed for critical business applications wherein the services are prioritized in order to reduce the latency of response when a congestion occurs. The priority queue classifies all messages into eight class: 7,6,5,4,3,2,1, and 0, in the order of priority. The group of critical services is put into the higher priority queue and non-critical business group is put into the lower priority queue. The higher priority queue is first emptied before the messages in the lower priority queue are sent. Messages in the group of non-critical business are transmitted in the idle gap of handling critical business data.

## Example

```
Device#configure terminal  
Device(config)#queue-scheduler strict-priority
```

## queue-scheduler sp-wrr

To configure strict priority and weighted round robin (WRR) queue scheduling algorithm on the queue scheduler, use the **queue-scheduler sp-wrr** command in the global configuration mode. To restore the default queue scheduler settings, use the **no** form of the command.

```
[no ]queue-scheduler sp-wrr {w1| w2| w3| w4| w5| w6| w7| w8}
```

|                           |   |  |
|---------------------------|---|--|
| <b>Syntax Description</b> | <i>wx</i><br>where x can be 1, 2, 3, 4, 5, 6, 7,8   | Specifies the weight of the queue represented by x.<br>For example, w1 represents the weight of the first queue. w2 represents the weight of the second queue. |
| <b>Command Default</b>    | Strict Priority scheduling is followed by default.  |  |
| <b>Command Modes</b>      | Global configuration (config)   |  |
| <b>Usage Guidelines</b>   | Strict-Priority and WRR queue scheduling combines the algorithms of strict-priority and Weighted round robin scheduling. If the weight of the queue is set to 0, the queue follows the Strict-Priority queuing algorithm to send messages. A non-zero value of the weight puts the queue to the WRR scheduling mechanism. |  |

### Example

```
Device#configure terminal
Device(config)#queue-scheduler sp-wrr 1 2 3 4 5 6 7 8
```

# queue-scheduler wrr

To configure the weighted round robin (WRR) queue scheduling algorithm on the queue scheduler, use the **queue-scheduler wrr** command in the global configuration mode. To restore the default queue scheduler settings, use the **no** form of the command.

```
[no ]queue-scheduler wrr{ w1| w2| w3| w4| w5| w6| w7| w8}
```

|                           |   |  |
|---------------------------|---|--|
| <b>Syntax Description</b> | <i>wx</i><br>where x can be 1, 2, 3, 4, 5, 6, 7,8 | Specifies the weight of the queue represented by x.<br>For example, w1 represents the weight of the first queue. w2 represents the weight of the second queue. |
|---------------------------|---|--|

**Command Default** Strict Priority scheduling is followed by default.

**Command Modes** Global configuration (config)

**Usage Guidelines** Weighted Round Robin (WRR) queue scheduling divides each port into eight output queues: 7, 6, 5, 4, 3, 2, 1, and 0, in the that order of priority, with 7 being the highest priority. All the queues are scheduled by turns and each queue gets a certain service time. Each queue of WRR can be configured with weighted values of w7, w6, w5, w4, w3, w2, w1, or w0. The weighted value represents the weight of the resource.

An advantage of WRR queuing is that although multiple queues are scheduled by polling, each queue is not assigned a fixed time slot. If a queue is empty, it immediately switches to the next queue schedule. So, the bandwidth and resources of that queue can be fully utilized

## Example

```
Device#configure terminal
Device(config)#queue-scheduler wrr 1 2 3 4 5 6 7 8
```

# queue-scheduler dscp-map

To configure the strict priority queue scheduling algorithm on the queue scheduler, use the **queue-scheduler dscp-map** command in the global configuration mode. To restore the default queue scheduler settings, use the **no** form of the command.

```
[no ]queue-scheduler dscp-map [dscp-value] [priority]
```

|                           |                   |  |
|---------------------------|-------------------|--|
| <b>Syntax Description</b> | <i>dscp-value</i> | Specifies the DSCP value which ranges from 0 through 63.     |
|                           | <i>priority</i>   | Specifies the 802.1p priority. The value ranges from 0 to 7. |

**Command Default** Strict Priority scheduling is followed by default.

**Command Modes** Global configuration (config)

**Usage Guidelines** DSCP mapping is disable by default. To enable DSCP mapping use the **queue-scheduler dscp-map** command. DSCP allows 64 priority values whereas 802.1p (hardware queue) allows only eight priority values. By default, the following is the mapping between DSCP and 802.1p:

| DSCP  | 802.1p |
|-------|--------|
| 0-7   | 0      |
| 8-15  | 1      |
| 16-23 | 2      |
| 24-31 | 3      |
| 32-39 | 4      |
| 40-47 | 5      |
| 48055 | 6      |
| 56-63 | 7      |

## Example

The following example shows how to map DSCP 56 to 802.1p priority 6:

```
Device#configure terminal
Device(config)#queue-scheduler dscp-map
Device(config)#queue-scheduler dscp-map 56 6
```

# rate-limit

To set the traffic rate limit in inbound or outbound direction, use the **rate-limit** command in the global configuration mode. To remove the rate limit, use the **no** form of the command.

```
[no] rate-limit {input | output} {[ip-group {num | name} [subitem subitem] ] [link-group {num | name} [subitem subitem] ] }target-rate
```

|                                  |  |
|----------------------------------|--|
| <b>input</b>                     | Specifies the rate limit in inbound direction.   |
| <b>output</b>                    | Specifies the rate limit in outbound direction.  |
| <b>ip-group { num   name }</b>   | Specifies a standard or extended ACL.  |
| <b>link-group { num   name }</b> | Specifies a Layer 2 ACL.   |
| <b>subitem subitem</b>           | Specifies the sub item in the ACL.   |
| <b>target-rate</b>               | <p>Specifies target rate which is the traffic rate limit in Kbps.</p> <p>Target rate should be a multiple of 64, and can range from 64 to 1048512.</p> |

**Command Modes** Global Configuration (config)

**Command Default** None

**Usage Guidelines** Use the **rate-limit input** command to limit the traffic rate in the inbound direction.

Use the **rate-limit output** command to limit the traffic rate in the outbound direction.

Use this command to monitor the rate of traffic that enters a device. If the traffic exceeds a certain threshold, you can define policies to take suitable measures.

## Example

The following example sets the inbound traffic rate limit to 100 Kbps:

```
Device#configure terminal
Device(config)#rate-limit input ip-group 3 100
```

**show bandwidth egress**

## show bandwidth egress

To display the rate limit and the burst rate that are set for the egress interface, use the **show bandwidth egress** command in privileged or global configuration mode.

```
show bandwidth egress[ interface {ethernet | gpon }port-num]
```

**Command Default** None

**Command Modes** Privileged (#)

Global Configuration (config)

### Example

The following is a sample output of the **show bandwidth** command.

```
Device(config)#show bandwidth egress
g0/1: bandwidth egress
    limit rate: / Kbps      burst: / Kbps

g0/2: bandwidth egress
    limit rate: / Kbps      burst: / Kbps

g0/3: bandwidth egress
    limit rate: / Kbps      burst: / Kbps
    ...
    ...
e2/2: bandwidth egress
    limit rate: / Kbps      burst: / Kbps
```

**Related Commands**

| Command                      | Description   |
|------------------------------|---|
| <b>bandwidth egress rate</b> | Sets the bandwidth limit on the outbound traffic on a port. |

# show qos-info all

To display the parameters that are set for Quality of Service (QoS), use the **show qos-info** command in privileged or global configuration mode.

```
show qos-info {all| traffic-copy-to-cpu | mirrored-to | traffic-priority
| traffic-redirect | traffic-statistic| statistic }
```

**Command Default** None

**Command Modes** Privileged (#)

Global Configuration (config)

**Usage Guidelines** Use the **show qos-info all** command to display all the configured QoS parameters.

Use the **show qos-info statistic** command to display all the statistics for QoS parameters.

Use the **show qos-info traffic-copy-to-cpu** command to display the parameter settings for copying messages to the CPU.

Use the **show qos-info mirrored-to** command to display the parameter settings for traffic mirroring.

Use the **show qos-info traffic-priority** command to display the parameter settings for traffic priority.

Use the **show qos-info traffic-redirect** command to display the parameter settings for message redirection.

## Example

```
Device#show qos-info all
mirrored-to(max 3 dest port):
traffic-priority:
traffic-redirect:
traffic-statistic:
traffic-copy-to-cpu:
```

Here is a sample output for the **show qos-info statistic** command:

```
Device#show qos-info statistic
mirrored-to:
total mirrored-to rules      : 0 rules

traffic-priority:
total traffic-priority rules   : 0 rules

traffic-redirect:
total traffic-redirect rules    : 0 rules

traffic-statistic:
total traffic-statistic rules   : 0 rules

traffic-copy-to-cpu:
total traffic-copy-to-cpu rules : 0 rules

total mirrored-to rules      : 0 rules
total traffic-priority rules   : 0 rules
```

```
show qos-info all
```

```
total traffic-redirect rules      : 0 rules
total traffic-statistic rules    : 0 rules
total traffic-copy-to-cpu rules : 0 rules
total qos-info rules            : 0 rules
```

**Related Commands**

| Command                    | Description   |
|----------------------------|---|
| <b>traffic-copy-to-cpu</b> | Copies all packets to the CPU.                                |
| <b>traffic-statistic</b>   | Configures the system to collect the traffic statistics       |
| <b>traffic-redirect</b>    | Redirects the traffic to a specified interface or to the CPU. |

# show qos-interface

To display all the policies set for Quality of Service (QoS) on the interface, use the **show qos-interface** command in privileged or global configuration mode.

```
show qos-interface {all| rate-limit | statistic}
```

**Command Default** None

**Command Modes** Privileged (#)

Global Configuration (config)

**Usage Guidelines** Use the **show qos-interface all** command to display all the QoS parameters for the interface.

Use the **show qos-interface rate-limit** command to display the rate limit parameters for the interface.

Use the **show qos-interface statistic** command to display the statistics of rate limit for all interfaces.

## Example

The following is a sample output of the **show qos-interface all** command:

```
Device#show qos-interface all
total qos-interface rules : 0 rules
```

The following is a sample output of the **show qos-interface rate-limit** command:

```
Device#show qos-interface rate-limit
total rate-limit rules : 0 rules
```

The following is a sample output of the **show qos-interface statistic** command:

```
Device#show qos-interface statistic
total qos-interface rules : 0 rules
```

**show queue-scheduler**

# show queue-scheduler

To display information about the queue scheduler, use the **show queue-scheduler** command in privileged or global configuration mode.

```
show queue-scheduler [ cos-map | dscp-map ]
```

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>cos-map</b> Specifies the 802.1p and hardware queue mapping.<br><b>dscp-map</b> Specifies the DSCP and 802.1p value mapping.  |
| <b>Command Default</b>    | None   |
| <b>Command Modes</b>      | Privileged (#)<br>Global Configuration (config)  |
| <b>Usage Guidelines</b>   | Use the <b>show queue-scheduler</b> command to display information about the queue scheduler parameters.<br>Use the <b>show queue-scheduler cos-map</b> command to display information about the mapping between 802.1p and hardware.<br>Use the <b>show queue-scheduler dscp-map</b> command to display information about the mapping between 802.1p values and DSCP. |

## Examples

Following are sample outputs for the **show queue-scheduler** commands.

```
Device#show queue-scheduler
Queue scheduler status : enable
Queue scheduler mode   : SP (Strict Priority)
```

```
Device#show queue-scheduler cos-map
Information about map of cos:
802.1P Priority Queue of class
-----
0          0
1          1
2          2
3          3
4          4
5          5
6          6
7          7
```

```
Device#show queue-scheduler dscp-map
dscp-pri has been disabled.
```

| Related Commands | Command                    | Description  |
|------------------|----------------------------|--|
|                  | <b>queue-scheduler wrr</b> | Configures the weighted round robin scheduling mode. |

| Command                                | Description                                     |
|--|---|
| <b>queue-scheduler strict-priority</b> | Configures the strict priority scheduling mode. |
| <b>queue-scheduler dscp-map</b>        | Maps DSCP values to hardware priority values.   |
| <b>queue-scheduler cos-map</b>         | Maps 802.1p values to hardware queue map.       |

# storm-control

To enable traffic storm control on an interface and to configure a threshold for the number of packets on the port, use the **storm-control** command in the interface configuration mode. To remove the storm control configuration on an interface, use the **no** form of the command.

```
[no]storm-control {broadcast | multicast | unicast } target-rate
```

|                           |  |  |
|---------------------------|--|--|
| <b>Syntax Description</b> | <b>broadcast</b><br><b>multicast</b><br><b>unicast</b><br><i>target-rate</i> | Specifies broadcast traffic for storm control.<br>Specifies multicast traffic for storm control.<br>Specifies unicast traffic for storm control.<br>Specifies a threshold limit for the number of packets on the port.<br>Value can range from 64 to 32000000 packets per second (pps)<br>Default value is 49984 pps |
|---------------------------|--|--|

|                        |                                     |
|------------------------|-------------------------------------|
| <b>Command Default</b> | None                                |
| <b>Command Modes</b>   | Interface Configuration (config-if) |

## Example

```
Device#configure terminal
Device(config)#interface e1/1

Device(config-if-ethernet-1/1)#storm-control unicast 512
Device(config-if-ethernet-1/1)#storm-control multicast 256
Device(config-if-ethernet-1/1)#storm-control broadcast 128
```

# traffic-copy-to-cpu

To copy the packets that match an ACL to CPU, use the **traffic-copy-to-cpu** command in the global configuration mode. To remove the traffic copy configuration, use the **no** form of the command.

```
[no] traffic-copy-to-cpu { [ip-group {num | name} [subitem subitem] ] [link-group {num | name} [subitem subitem] ] }
```

|                                |                                       |
|--------------------------------|---------------------------------------|
| <b>ip-group {num   name}</b>   | Specifies a standard or extended ACL. |
| <b>link-group {num   name}</b> | Specifies a Layer 2 ACL.              |
| <b>subitem subitem</b>         | Specifies the sub item in the ACL.    |

**Command Modes** Global Configuration (config)

**Command Default** None

## Example

The following example shows how to copy packets that match the subitem number 2 of ACL numbered 3 to CPU:

```
Device#configure terminal
Device(config)#traffic-copy-to-cpu ip-group 3 subitem 2
```

# traffic-redirect

To redirect the messages sent to a port, use the **traffic-redirect** command in the global configuration mode. To remove the redirect configuration, use the **no** form of the command.

```
[no] traffic-redirect { [ip-group {num | name} [subitem subitem] ] [link-group {num | name} [subitem subitem] ] [interface interface-num | cpu] }
```

|                                |   |
|--------------------------------|---|
| <b>ip-group {num   name}</b>   | Specifies a standard or extended ACL.                       |
| <b>link-group {num   name}</b> | Specifies a Layer 2 ACL.                                    |
| <b>subitem subitem</b>         | Specifies the sub item in the ACL.                          |
| <b>interface interface-num</b> | Specifies the interface to which the traffic is redirected. |
| <b>cpu</b>                     | Specifies that the traffic is redirected to the CPU.        |

**Command Modes** Global Configuration (config)

**Command Default** None

**Usage Guidelines** Use the **traffic-redirect** command to forward the traffic to an egress port or a CPU, using the specified access control list (ACL) sub items.

## Example

The following example shows how to redirect traffic to the ethernet 1/1 interface:

```
Device#configure terminal
Device(config)#traffic-redirect link-group link1 interface ethernet 1/1
```

# traffic-statistic

To configure a device to collect traffic statistics, use the **traffic-statistic** command in global configuration mode. To remove the traffic statistic configuration, use the **no** form of the command.

```
[no] traffic-statistic { [ip-group {num | name} [subitem subitem] ] [link-group {num | name} [subitem subitem] ] }
```

|                                |                                       |
|--------------------------------|---------------------------------------|
| <b>ip-group {num   name}</b>   | Specifies a standard or extended ACL. |
| <b>link-group {num   name}</b> | Specifies a Layer 2 ACL.              |
| <b>subitem subitem</b>         | Specifies the sub item in the ACL.    |

**Command Modes** Global Configuration (config)

**Command Default** None

**Usage Guidelines** Use this command to configure the device to collect traffic statistics. This command displays a cumulative value of the count of the number of packets that matched the ACL rule.

If you reconfigure traffic statistics, the previous information is lost.

## Example

```
Device#configure terminal
Device(config)#traffic-statistic ip-group 3
```

| <b>Command Modes</b>      | Global Configuration (config) |  |
| <b>Command Default</b>    | None                          |  |

## Example

```
Device#configure terminal
Device(config)#time-range weekends
Device(config-timerange-weekends)#absolute start 04:50:30 2020/04/01 end 09:50:40 2020/04/30
```

# access-limit

To enable or disable the number limit of authentication users in the domain and set the number limit of allowed users, use the **access-limit** command in AAA configuration mode.

```
access-limit {enable allowed-user-number-limit | disable}
```

|                           |   |  |
|---------------------------|---|--|
| <b>Syntax Description</b> | <b>enable</b><br><i>allowed-user-number-limit</i><br><b>disable</b> | Enables the number limit of authentic domain<br>Sets the number limit of allowed users.<br>The range is from 1 to 640.<br>Disables the number limit of authentic domain. |
|---------------------------|---|--|

**Command Modes** AAA configuration (config-aaa)

## Example

This example shows how to enable the number limit of authentication users in the domain and set the number limit of allowed users:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# domain eee
Device(config-aaa-domain-eee)# exit
Device(config-aaa)# default domain-name enable eee
Device(config-aaa)# domain eee
Device(config-aaa-domain-eee)# access-limit enable 3
Succeed to set MaxLinks of domain.
```

## Example

This example shows how to disable the number limit of authentication users in the domain and set the number limit of allowed users:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# default domain-name enable eee
Succeed in setting default domain.
Device(config-aaa)# domain eee
Device(config-aaa-domain-eee)# access-limit disable
Succeed to disable access limit of domain.
```

# access-list match-order

To configure the access control list (ACL) matching order, use the **access-list match-order** command in the global configuration mode. The matching order decides which rule is executed.

```
access-list acl-num match-order {auto | config}
```

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>auto</b> Matches the ACL rules according to the depth-first rule, wherein the longest subitem in a rule takes priority. The longest subset of a rule is matched first before the rule.<br><b>config</b> Matches the ACL rules according to the configuration order. |
| <b>Command Default</b>    | None   |
| <b>Command Modes</b>      | Global configuration (config)  |
| <b>Usage Guidelines</b>   | An ACL consists of multiple permit or deny rules. The rules may overlap or conflict. In such cases, the matching order decides which rule is executed.   |

## Example

```
Device#configure terminal  
Device(config)#access-list 2 match-order config
```

**access-group**

## access-group

To activate an access control list that is already defined, use the **access-group** command in the global configuration mode.

**access-group [ip-group [name | number] ] [link-group [name | number] ] [subitem number]**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>ip-group [name   number]</b> Specifies a predefined Standard ACL or Extended ACL.<br><b>link-group [name   number]</b> Specifies a predefined Layer 2 ACL.<br><b>subitem number</b> Specifies the sub item number in the ACL                           |
| <b>Command Modes</b>      | Global Configuration (config)   |
| <b>Command Default</b>    | None  |
| <b>Usage Guidelines</b>   | After defining an Access Control List (ACL), it has to be activated to take effect. Use the <b>access-group ip-group</b> command to activate a Standard ACL or an Extended ACL. Use the <b>access-group link-group</b> command to activate a Layer 2 ACL. |

### Example

The following example creates a standard access control list (ACL), 10, and activates the subitem number 1 of the ACL.

```
Device#configure terminal
Device(config)#access-list 10 deny any

Device(config)#access-list 10 permit 10.1.1.5 0
Device(config)#access-group ip-group 10
```

# access-list numbered standard

To define a numbered Standard Access Control List (ACL), use the **access-list number** command in the global configuration mode.

```
access-list num{permit |deny} { source-ipv4 | ipv6-source-prefix | any | ipv6any}
[ time-range timerange-name]
```

## Syntax Description

|                                  |  |
|----------------------------------|--|
| <b>permit</b>                    | Specifies that the rule defined by the ACL is permitted.     |
| <b>deny</b>                      | Specifies that the rule defined by the ACL is not permitted. |
| <i>source-ipv4</i>               | Specifies the IPv4 address of the source host.               |
| <i>ipv6-source-prefix</i>        | Specifies the IPv6 prefix of the source host.                |
| <b>ipv6any</b>                   | Specifies any IPv6 host                                      |
| <b>any</b>                       | Specifies any IPv4 host                                      |
| <b>time-rangetime-range-name</b> | Defines the specific time range to implement the ACL.        |

## Command Default

None

## Command Modes

Global configuration (config)

## Usage Guidelines

The ACL is identified by the number assigned to it. You can create an ACL and assign a number to it. If you don't specify a number, the system assigns a number to the created ACL. For a Standard ACL, the numbers range from 1 through 99. You can create up to 99 Standard ACLs.

## Example

```
Device#configure terminal
Device(config)#access-list 10 permit any
```

# access-list standard

To create a named Standard Access Control List, use the **access-list standard** command in the global configuration mode.

```
access-list standard {num|name} [ match-order { auto | config } ]
```

|                           |   |            |   |             |  |
|---------------------------|---|------------|---|-------------|--|
| <b>Syntax Description</b> | <table border="0"> <tr> <td><i>num</i></td><td>Specifies a standard ACL. Values can range from 1 through 99.</td></tr> <tr> <td><i>name</i></td><td>Specifies a name for the ACL. The name is a string of alphanumeric characters, upto 32 characters in length.</td></tr> </table> | <i>num</i> | Specifies a standard ACL. Values can range from 1 through 99. | <i>name</i> | Specifies a name for the ACL. The name is a string of alphanumeric characters, upto 32 characters in length. |
| <i>num</i>                | Specifies a standard ACL. Values can range from 1 through 99.   |            |   |             |  |
| <i>name</i>               | Specifies a name for the ACL. The name is a string of alphanumeric characters, upto 32 characters in length.  |            |   |             |  |
| <b>match-order</b>        | Defines a matching order for the entries in the ACL.  |            |   |             |  |
| <b>config</b>             | Matches the ACL rules according to the configuration order in the list.   |            |   |             |  |
| <b>auto</b>               | Matches the ACL rules according to the depth-first rule, wherein the longest subitem in a rule takes priority. The longest subset of a rule is matched first before the rule.   |            |   |             |  |
| <b>Command Default</b>    | None  |            |   |             |  |
| <b>Command Modes</b>      | Global configuration (config)   |            |   |             |  |

## Example

```
Device#configure terminal
Device(config)#access-list standard stdacl
```

# accounting-on

To configure accounting-on function, use the **accounting-on** command in AAA configuration mode.

**accounting-on {enable *packet-number* | disable}**

|                           |                      |  |
|---------------------------|----------------------|--|
| <b>Syntax Description</b> | <b>enable</b>        | Enables accounting-on function.                                |
|                           | <i>packet-number</i> | The number of accounting-on packets.<br>The range is 1 to 255. |
|                           | <b>disable</b>       | Disables accounting-on function.                               |

|                      |                                |
|----------------------|--------------------------------|
| <b>Command Modes</b> | AAA configuration (config-aaa) |
|----------------------|--------------------------------|

## Example

This example shows how to enable the accounting-on function:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# accounting-on enable 10
configure success
```

acct-secret-key

## acct-secret-key

To configure the shared key of the secondary RADIUS server, use the **acct-secret-key** command in AAA configuration mode. To delete the configured shared key of the secondary RADIUS server, use the **no** form of the command.

**acct-secret-key***key*

**no acct-secret-key**

|                           |                                |                        |
|---------------------------|--------------------------------|------------------------|
| <b>Syntax Description</b> | <i>key</i>                     | The shared secret key. |
| <b>Command Modes</b>      | AAA Configuration (config-aaa) |                        |

### Example

This example shows how to configure the shared key of a secondary RADIUS server using the **acct-secret-key** command:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius host radius1
Device(config-aaa-radius-radius1)# acct-secret-key 1
    Modify secret key of RADIUS configuration successfully
```

# anti-dos ip fragment

To configure a new threshold value for IP fragmentations, use the **anti-dos ip fragment** command in global configuration mode. To restore the default threshold value, use the **no** form of the command.

**anti-dos ip fragment** *threshold-value*

**no anti-dos ip fragment**

| Syntax Description | <i>threshold-value</i> | The maximum number of allowed fragments. |
|--------------------|------------------------|--|
|                    |                        | The range is 0 to 800.                   |
|                    |                        | The default value is 800.                |

|               |                               |
|---------------|-------------------------------|
| Command Modes | Global Configuration (config) |
|---------------|-------------------------------|

## Example

This example shows how to configure a new threshold value for IP fragmentations using the **anti-dos ip fragment** command:

```
Device> enable
Device# configure terminal
Device(config)# anti-dos ip fragment 100
```

## anti-dos ip ttl

To enable TTL monitoring and anti-TTL attack, use the **anti-dos ip ttl** command in global configuration mode. To disable TTL monitoring and anti-TTL attack, use the **no** form of the command.

**anti-dos ip ttl**

**no anti-dos ip ttl**

**Command Default** Messages with TTL with a value of 0 are discarded.

**Command Modes** Global Configuration (config)

### Example

This example shows how to enable TTL monitoring using the **anti-dos ip ttl** command:

```
Device> enable
Device# configure terminal
Device(config)# anti-dos ip ttl
```

# arp anti-spoofing

To enable ARP anti-spoofing, use the **arp anti-spoofing** command in global configuration mode. To disable ARP anti-spoofing, use the **no** form of the command.

**arp anti-spoofing**

**no arp anti-spoofing**

---

**Command Modes** Global Configuration (config)

## Example

This example shows how to enable ARP anti-spoofing using the **arp anti-spoofing** command:

```
Device> enable
Device# configure terminal
Device(config)# arp anti-spoofing
Device(config)#
```

■ arp anti-spoofing deny-disguiser

## arp anti-spoofing deny-disguiser

To enable ARP gateway anti-spoofing, use the **arp anti-spoofing deny-disguiser** command in global configuration mode. To disable ARP gateway anti-spoofing, use the **no** form of the command.

**arp anti-spoofing deny-disguiser**

**no arp anti-spoofing deny-disguiser**

**Command Modes** Global Configuration (config)

### Example

This example shows how to enable ARP gateway anti-spoofing using the **arp anti-spoofing deny-disguiser** command:

```
Device> enable
Device# configure terminal
Device(config)# arp anti-spoofing deny-disguiser
Device(config)#

```

# arp anti-spoofing unknown

To enable ARP anti-spoofing and configure the device to flood or disable unknown packets, use the **arp anti-spoofing unknown** command in global configuration mode.

```
arp anti-spoofing unknown {flood | disable}
```

| Syntax Description | flood   | Floods the unknown packets.   |
|--------------------|---------|-------------------------------|
|                    | disable | Disables the unknown packets. |

Command Modes Global Configuration (config)

## Example

This example shows how to flood the unknown packets using the **arp anti-spoofing unknown flood** command:

```
Device> enable
Device# configure terminal
Device(config)# arp anti-spoofing unknown flood
Device(config)#

```

## Example

This example shows how to disable the unknown packets using the **arp anti-spoofing unknown disable** command:

```
Device> enable
Device# configure terminal
Device(config)# arp anti-spoofing unknown disable
Device(config)#

```

**arp anti-spoofing valid-check**

## arp anti-spoofing valid-check

To enable ARP anti-spoofing and configure source MAC address consistency inspection, use the **arp anti-spoofing valid-check** command in global configuration mode. To disable source MAC address consistency inspection, use the **no** form of the command.

**arp anti-spoofing valid-check****no arp anti-spoofing valid-check**

---

**Command Modes** Global Configuration (config)

### Example

This example shows how to enable source MAC address consistency inspection using the **arp anti-spoofing valid-check** command:

```
Device> enable
Device# configure terminal
Device(config)# arp anti-spoofing valid-check
Device(config)#
Device>
```

# arp anti-flood

To enable ARP anti-flooding attack and configure its parameters on all ports, use the **arp anti-flood** command in global configuration mode.

To enable ARP anti-flooding attack and configure its parameters on a specific port, use the **arp anti-flood** command in interface configuration mode.

To disable ARP anti-flooding attack, use the **no** form of the command.

```
arp anti-flood [ [action {deny-all | deny-arp}] [ threshold threshold-value ] | recover {mac-address | all} | recover-time time ]
```

```
no arp anti-flood [ recover-time | threshold ]
```

|                           |                                  |  |
|---------------------------|----------------------------------|--|
| <b>Syntax Description</b> | <b>action deny-all</b>           | Adds the host to a blackhole address table to drop all ARP packets.  |
|                           | <b>action deny-arp</b>           | Adds the host to a blackhole address table to drop all ARP packets.  |
|                           | <b>threshold threshold-value</b> | Configures the ARP anti-flood threshold value.<br>The default value is 16 packets per second.  |
|                           | <b>recover mac-address</b>       | Manually restores the host with the specified MAC address to transmit again.   |
|                           | <b>recover all</b>               | Manually restores all the hosts to transmit again.   |
|                           | <b>recover-time time</b>         | Defines the recovery time interval for hosts to be allowed to transmit again.<br>The recovery interval is 0 to 1440 seconds.<br>The default value is 10 minutes. |

|                      |  |
|----------------------|--|
| <b>Command Modes</b> | Global configuration (config)<br>Interface configuration (config-if) |
|----------------------|--|

## Example

This example shows how to configure ARP anti-flooding attack using the **arp anti-flood** command:

```
Device> enable
Device# configure terminal
Device(config)# arp anti-flood
Device(config) #
```

**Example**

This example shows how to add the host to a blackhole address list and discard all packets using the **arp anti-flood action deny-all** command:

```
Device> enable
Device# configure terminal
Device(config)# arp anti-flood action deny-all
Device(config)#

```

**Example**

This example shows how to configure ARP anti-flooding threshold value using the **arp anti-flood threshold threshold-value** command:

```
Device> enable
Device# configure terminal
Device(config)# arp anti-flood threshold 30
Device(config)#

```

**Example**

This example shows how to manually restore the host to transmit again using the **arp anti-flood recover** command:

```
Device> enable
Device# configure terminal
Device(config)# arp anti-flood recover 00:00:00:00:32:33
Device(config)#

```

**Example**

This example shows how to define the recovery time interval after which a host is allowed to transmit again using the **arp anti-flood recover-time time** command:

```
Device> enable
Device# configure terminal
Device(config)# arp anti-flood recover-time 100
Device(config)#

```

# channel-group spanning-tree cost

To configure the path cost of an STP aggregation group, use the **channel-group *group-id* spanning-tree cost** command in global configuration mode. To restore the default path cost of an STP aggregation group, use the **no** form of the command.

**channel-group *group-id* spanning-tree cost *path-cost***

**no channel-group *group-id* spanning-tree cost**

| Syntax Description |                  |   |
|--------------------|------------------|---|
|                    | <i>group-id</i>  | The channel group ID.<br>The range is 0 to 5.                           |
|                    | <i>path-cost</i> | The path cost of the aggregation group.<br>The range is 1 to 200000000. |

**Command Modes** Global configuration (config)

## Example

This example shows how to configure the path cost of an aggregation group using the **channel-group *group-id* spanning-tree cost** command:

```
Device> enable
Device# configure terminal
Device(config)# channel-group 1 spanning-tree cost 2000
Device(config)#

```

**clear cpu-classification**

# clear cpu-classification

To clear the CPU packet classification statistics, run the **clear cpu-classification** command in global configuration mode.

**clear cpu-classification interface {ethernet | gpon}slot-number/port-number**

|                           |                                |   |
|---------------------------|--------------------------------|---|
| <b>Syntax Description</b> | <i>slot-number/port-number</i> | The port ID.  |
|                           |                                | <ul style="list-style-type: none"> <li>• <i>slot-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The value is 0.</li> <li>• GE Ethernet: The value is 1.</li> <li>• 10GE Ethernet: The value is 2.</li> </ul> </li> </ul>                                  |
|                           |                                | <ul style="list-style-type: none"> <li>• <i>port-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The range is from 1 to 16.</li> <li>• GE Ethernet: The range is from 1 to 48.</li> <li>• 10GE Ethernet: The range is from 1 to 16.</li> </ul> </li> </ul> |
|                           |                                |   |

**Command Default** None

**Command Modes** Global configuration (config)

## Example

This example shows how to clear the CPU packet classification statistics:

```
Device> enable
Device# configure terminal
Device(config)# clear cpu-classification interface ethernet 1/3
Clear packets sent to cpu classification statistics successfully
```

# clear cpu-statistics

To clear the port statistics, use the **clear cpu-statistics** command in privileged EXEC and global configuration modes.

## clear cpu-statistics

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |  |
|----------------------|--|
| <b>Command Modes</b> | Privileged EXEC (#)<br>Global configuration (config) |
|----------------------|--|

|                 |  |
|-----------------|--|
| <b>Examples</b> | This example shows how to clear the port statistics. |
|-----------------|--|

```
Device> enable
Device# configure terminal
Device(config)# clear cpu-statistics
Clear packet sent to cpu statistic information successfully
```

# cpu-car

To configure the CPU-car rate limit for packets, use the **cpu-car** command in global configuration mode. To restore the default CPU-car rate limit, use the **no** form of the command.

**cpu-car rate-limit**

**no cpu-car**

|                           |                   |   |
|---------------------------|-------------------|---|
| <b>Syntax Description</b> | <i>rate-limit</i> | Configures the CPU-car rate limit.            |
|                           |                   | The range is 1 to 10000 packets per second.   |
|                           |                   | The default value is 4000 packets per second. |

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

## Example

This example shows how to configure real time accounting using the **realtime-account** command:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius host radius1
Device(config-aaa-radius-radius1)# realtime-account interval 25
    Modify realtime_acct configuration of radius server successfully.
```

# cpu-limit

To configure the CPU limit rate for packet types, use the **cpu-limit** command in global configuration mode. To restore the default CPU limit rate for packet types, use the **no** form of the command.

```
cpu-limit { arp | bpdu | broadcast | dhcp | icmp | igmp | mld | ospf | other | rip | snmp | ssh | switch-dst-mac | telnet } rate
```

```
no cpu-limit
```

---

**Syntax Description**

*rate* Configures the CPU-limit rate.

The range is 1 to 10000 packets per second.

---

**Command Default**

By default, no limit is configured.

**Command Modes**

Global configuration (config)

**Example**

This example shows how to configure CPU limit rate for ARP packets:

```
Device> enable
Device# configure terminal
Device(config)# cpu-limit arp 100
```

# dhcp anti-attack

To enable DHCP packet monitoring and configure the monitoring parameters on all ports, use the **dhcp anti-attack** command in global configuration mode.

To enable DHCP packet monitoring and configure the monitoring parameters on a specific port, use the **dhcp anti-attack** command in interface configuration mode.

To disable DHCP packet monitoring and restore the parameters to their default values, use the **no** form of the command.

```
dhcp anti-attack [ [action {deny-all | deny-dhcp}] [threshold threshold-value] | [bind blackhole | recover] {mac-address | all} | recover-time time]
```

```
no dhcp anti-attack [recover-time | threshold]
```

|                           |  |  |
|---------------------------|--|--|
| <b>Syntax Description</b> | <b>action deny-all</b>                   | Adds the host to a blackhole address list.<br>packets.   |
|                           | <b>action deny-dhcp</b>                  | Adds the host to a blackhole address list.<br>DHCP packets.  |
|                           | <b>threshold</b> <i>threshold-value</i>  | Configures the rate threshold for DHCP.<br>The default value is 16 packets per second.                                     |
|                           | <b>bind blackhole</b> <i>mac-address</i> | Binds the dynamic MAC address generated by the static MAC address for the specified blackhole address list.                |
|                           | <b>bind blackhole</b> <b>all</b>         | Binds the dynamic MAC address generated by the static MAC address for all the MAC addresses in the blackhole address list. |
|                           | <b>recover</b> <i>mac-address</i>        | Manually restores the table items for the specified MAC address.   |
|                           | <b>recover</b> <b>all</b>                | Manually restores the table items for all the MAC addresses.   |
|                           | <b>recover-time</b> <i>time</i>          | Defines the recovery time interval.<br>The recovery interval is 0 to 1440 minutes.<br>The default value is 10 minutes.     |

## Command Modes

Global configuration (config)  
Interface configuration (config-if)

## Example

This example shows how to configure DHCP packet monitoring using the **dhcp anti-attack** command:

```
Device> enable
Device# configure terminal
Device(config)# dhcp anti-attack
Device(config)#

```

### Example

This example shows how to configure DHCP packet monitoring and discard all packets using the **dhcp anti-attack action deny-all** command:

```
Device> enable
Device# configure terminal
Device(config)# dhcp anti-attack action deny-all
Device(config)#

```

### Example

This example shows how to configure the threshold value for DHCP packet globally using the **dhcp anti-attack threshold** command:

```
Device> enable
Device# configure terminal
Device(config)# dhcp anti-attack threshold 10
Device(config)#

```

### Example

This example shows how to manually restore the table items for the host using the **dhcp anti-attack recover** command:

```
Device> enable
Device# configure terminal
Device(config)# dhcp anti-attack recover all
Device(config)#

```

### Example

This example shows how to configure recovery time interval using the **dhcp anti-attack recover-time** command:

```
Device> enable
Device# configure terminal
Device(config)# dhcp anti-attack recover-time 100
Device(config)#

```

# discard-bpdu

To enable the local discard of external BPDU messages, use the **discard-bpdu** command in global configuration mode. To disable the local discard of external BPDU messages, use the **no** form of the command.

**discard-bpdu**

**no discard-bpdu**

---

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

## Example

This example shows how to enable the local discard of external BPDU messages using the **discard-bpdu** command:

```
Device> enable
Device# configure terminal
Device(config)# discard-bpdu
Enable discard bpdu successfully.
```

# access-list extended name

To create a named Extended Access Control List, use the **access-list extended** command in the global configuration mode.

```
access-list extended {num|name} [ match-order { auto | config } ]
```

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> |   |
| <i>num</i>                | Specifies an extended ACL. Values can range from 100 through 199.   |
| <i>name</i>               | Specifies a name for the ACL. The name is a string of alphanumeric characters, upto 32 characters in length.  |
| <b>match-order</b>        | Defines a matching order for the entries in the ACL.  |
| <b>config</b>             | Matches the ACL rules according to the configuration order in the list.   |
| <b>auto</b>               | Matches the ACL rules according to the depth-first rule, wherein the longest subitem in a rule takes priority. The longest subset of a rule is matched first before the rule. |
| <b>Command Default</b>    | None  |
| <b>Command Modes</b>      | Global configuration (config)   |

## Example

```
Device#configure terminal
Device(config)#access-list extended extacl match-order auto
```

# access-list numbered extended

To define a numbered Extended Access Control List (ACL), use the **access-list number** command in the global configuration mode.

```
access-list number {permit |deny} [protocol] [established] { source-ipv4 |  
 ipv6-source-prefix | any | ipv6any} [source-port-wildcard] { dest-ipv4 | ipv6-dest-prefix | any  
 | ipv6any} [dest-port-wildcard] [ icmp type icmp-code] [igmp-type] [ traffic-class traffic-class]  
 [ precedence precedence ] [ tos tos ] [ dscp dscp] [ fragments ] [ time-range  
 time-range ]
```

| Syntax Description         |   |
|----------------------------|---|
| <b>permit</b>              | Specifies that the rule defined by the ACL is permitted.  |
| <b>deny</b>                | Specifies that the rule defined by the ACL is not permitted.  |
| <b>protocol</b>            | Specifies the type of Layer 2 protocol.<br>It is in the range of 1 through 255 by number.<br>Select from GRE, ICMP, IGMP, IPinIP, OSPF, TCP, UDP, and ICMPv6 to specify the protocol by name. |
| <b>established</b>         | Defines the SYN flag in TCP. A value 1 indicates that the flag is active. This is applicable only if the <i>protocol</i> is <i>tcp</i> .  |
| <i>source-ipv4</i>         | Specifies the IPv4 address of the source host.  |
| <i>ipv6-source-prefix</i>  | Specifies the IPv6 prefix of the source host.   |
| <b>ipv6any</b>             | Specifies any IPv6 host   |
| <i>dest-ipv4</i>           | Specifies the IPv4 address of the destination host.   |
| <i>ipv6-dest-prefix</i>    | Specifies the IPv6 prefix of the destination host.  |
| <b>any</b>                 | Specifies any host.   |
| <i>icmp type icmp-code</i> | Specifies the type of ICMP protocol packet. It is valid only when protocol is configured as <b>icmp</b> or <b>icmpv6</b> .  |
| <i>igmp-type</i>           | Specifies the type of IGMP protocol packet. It is valid only when protocol is configured as <b>igmp</b> .   |
| <b>traffic-class</b>       | Specifies the traffic class for IPv6.   |
| <b>precedence</b>          | Specifies the precedence priority. IP precedence ranges from 0 through 7.   |
| <b>tos</b>                 | Specifies the Type of Service (ToS) priority. The values range from 0 through 15.   |
| <b>dscp</b>                | Specifies the Differentiated Services Code Point (DSCP) priority value.   |
| <b>fragments</b>           | Specifies that the ACL rule is valid for non-first fragmented packets. This helps prevent fragment packet attacks.  |

---

**time-range *timerange-name*** Defines the specific time range to implement the ACL.

---

**Command Default** None

**Command Modes** Global configuration (config)

**Usage Guidelines** The ACL is identified by the number assigned to it. You can create an ACL and assign a number to it. If you don't specify a number, the system assigns a number to the created ACL. For an Extended ACL, the numbers range from 100 through 199. You can create up to 100 Extended ACLs.

### Example

```
Device#configure terminal  
Device(config)#access-list 101 permit tcp 10.0.0.1 0 ftp any
```

**host-guard bind ip**

# host-guard bind ip

To configure host protection on a port, use the **host-guard bind ip** command in global configuration mode. To disable host protection on a port, use the **no** form of the command.

```
host-guard bind ip ip-address interface { ethernet slot_number/port_number | gpon slot_number/port_number } [ to | ethernet slot_number/port_number | gpon slot_number/port_number ]
```

```
no host-guard bind ip ip-address interface { ethernet slot_number/port_number | gpon slot_number/port_number } [ to | ethernet slot_number/port_number | gpon slot_number/port_number ]
```

## Syntax Description

**to**

Displays the information for a range of ports. When you enter the **to** keyword, specify the same port type as the **slot-number/port-number** keyword.

**slot-number/port-number**

The port ID.

- *slot-number*:

- GPON: The value is 0.
- GE Ethernet: The value is 1.
- 10GE Ethernet: The value is 2.

- *port-number*:

- GPON: The range is from 1 to 16.
- GE Ethernet: The range is from 1 to 16.
- 10GE Ethernet: The range is from 1 to 16.

## Command Modes

Global configuration (config)

## Examples

This example shows how to configure host protection on a port using the **host-guard bind ip** command:

```
Device> enable
Device# configure terminal
Device(config)# host-guard bind ip 10.10.10.1 interface ethernet 1/3
      Add host guard entry successfully.
```

# ip route

To add a static IP route to the routing table, use the **ip route** command in the global configuration mode. To remove a static IP route from the routing table, use the **no** form of the command.

**ip route** *dest-ip* *mask* [*gate-ip*]

**no ip route** *dest-ip* *mask* [*gate-ip*]

|                           |                |  |
|---------------------------|----------------|--|
| <b>Syntax Description</b> | <i>dest-ip</i> | The destination address of the static route. |
|                           | <i>mask</i>    | The mask of the destination address.         |
|                           | <i>gate-ip</i> | The next-hop address of the static route.    |

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

## Example

This example shows how to add a static IP route to the routing table using the **ip route** command:

```
Device> enable
Device# configure terminal
Device(config)# ip route 10.10.10.10 255.255.0.0 10.0.11.254
```

**access-list link name**

## access-list link name

To create a named Layer 2 Access Control List (ACL), use the **access-list link** command in the global configuration mode.

```
access-list link {num|name} [ match-order { auto | config } ]
```

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <p><b>num</b> Specifies an extended ACL. Values can range from 200 through 299.</p> <p><b>name</b> Specifies a name for the ACL. The name is a string of alphanumeric characters, upto 32 characters in length.</p> |
|                           | <b>match-order</b> Defines a matching order for the entries in the ACL.   |
|                           | <b>config</b> Matches the ACL rules according to the configuration order in the list.   |
|                           | <b>auto</b> Matches the ACL rules according to the depth-first rule, wherein the longest subitem in a rule takes priority. The longest subset of a rule is matched first before the rule.                           |
| <b>Command Default</b>    | None  |
| <b>Command Modes</b>      | Global configuration (config)   |

### Example

```
Device#configure terminal
Device(config)#access-list link laye2acl match-order auto
```

# access-list link number

To define a numbered Layer 2 Access Control List (ACL), use the **access-list number** command in the global configuration mode.

```
access-list number {permit | deny} [protocol] [cos vlan-priority] ingress { { [inner-vidvid] [start-vlan-id end-vlan-id] [source-mac-addr source-mac-wildcard] [interface interface-number] } | any } egress { { [dest-mac-addr dest-mac-wildcard] [interface interface-num | cpu] } | any} [ time-range time-range ]
```

| Syntax Description      | <b>permit</b>   | Specifies that the rule defined by the ACL is permitted.   |
|-------------------------|---|--|
|                         | <b>deny</b>   | Specifies that the rule defined by the ACL is not permitted.   |
|                         | <b>protocol</b>   | Specifies the type of protocol packet carried by the Ethernet frame.<br>In hexadecimal notation, the range is 0 through FFFF. It is optional in case of ARP, IP, RARP. |
|                         | <b>cos</b>  | Defines the SYN flag in TCP. A value 1 indicates that the flag is active. This is applicable only if the <i>protocol</i> is tcp.                                       |
|                         | <b>ingress</b>  | Specifies the rule for the incoming packets at the ingress port.   |
|                         | <b>inner-vid</b>  | Specifies the inner VLAN ID of a double-tagged packet.   |
|                         | <b>start-vlan-id end-vlan-id</b>  | Specifies the range of VLANs.<br>For a double-tagged packet, it is the VLAN ID of the outer tag.   |
|                         | <b>source-mac-addr</b>  | Specifies the source MAC address options.  |
|                         | <b>source-mac-wildcard</b>  | <i>source-mac-wildcard</i> indicates the source MAC range.   |
|                         | <b>interface interface-num</b>  | Specifies the physical port number. It can be either the ingress port or the egress port.  |
|                         | <b>CPU</b>  | Indicates that the data will be forwarded to the CPU.  |
|                         | <b>any</b>  | Specifies any address which can be at ingress or egress directions.  |
|                         | <b>time-range name</b>  | Specifies the time range in which the ACL rule takes effect.   |
|                         | <b>time-range timerange-name</b>  | Defines the specific time range to implement the ACL.  |
| <b>Command Default</b>  | None  |  |
| <b>Command Modes</b>    | Global configuration (config)   |  |
| <b>Usage Guidelines</b> | The ACL is identified by the number assigned to it. You can create an ACL and assign a number to it. If you don't specify a number, the system assigns a number to the created ACL. For an Extended ACL, the numbers range from 200 through 299. You can create up to 100 Layer 2 ACLs. |  |

access-list link number

### Example

```
Device# configure terminal  
Device(config)# access-list 201 permit arp ingress 00:00:00:00:01:01 0 egress any
```

# local-user

To configure a local user, use the **local-user** command in the AAA configuration mode. To delete all local users, use the **no** form of the command.

**local-user username *username* password *password* [vlan *vlan-id*]**

**no local-user {all | user *username*}**

| Syntax Description |                 |   |
|--------------------|-----------------|---|
|                    | <i>username</i> | Username of the local user.             |
|                    | <i>password</i> | Password of the local user.             |
|                    | <i>vlan-id</i>  | The VLAN ID.<br>The range is 1 to 4094. |

| Command Modes | AAA configuration (config-aaa) |
|---------------|--------------------------------|
|---------------|--------------------------------|

## Example

This example shows how to configure a local user using the **local-user** command:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# local-user username name1 password pass1 vlan 220
Device(config-aaa)#
Device>
```

# nas-ipaddress

To configure the NAS client IP address for a RADIUS server, use the **nas-ipaddress** command in AAA configuration mode. To delete the configured NAS client IP address for a RADIUS server, use the **no** form of the command.

**nas-ipaddress** *ip-address*

**no nas-ipaddress**

|                           |                                |                              |
|---------------------------|--------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>ip-address</i>              | IP address of RADIUS client. |
| <b>Command Modes</b>      | AAA configuration (config-aaa) |                              |

## Example

This example shows how to configure the NAS client IP address for a RADIUS server:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius host radius1
Device(config-aaa-radius-radius1)# nas 10.1.1.10
```

# no ip route static all

To delete all static IP routes from the routing table, use the **no ip route static all** command in global configuration mode.

## no ip route static all

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

## Example

This example shows how to delete all static IP routes from the routing table using the **no ip route static all** command:

```
Device> enable
Device# configure terminal
Device(config)# no ip route static all
```

# periodic time-range

To configure a time period that specifies when an access control list (ACL) is in effect, use the **periodic** command in the time-range configuration mode. To remove the absolute time-range, use the **no** form of the command.

```
[no]periodic [days-of-week] HH:MM:SS to [days-of-week ] HH:MM:SS
```

|                           |   |  |
|---------------------------|---|--|
| <b>Syntax Description</b> | <p><i>days-of-week</i></p> <p><i>HH:MM:SS</i></p> | <p>Specifies the period, which are the days of the week:<br/> <b>mon</b>, <b>tue</b>, <b>wed</b>, <b>thu</b>, <b>fri</b>, <b>sat</b>, <b>sun</b>, <b>weekdays</b>, <b>daily</b><br/> <b>weekdays</b> are Monday to Friday.</p> <p>Specifies the time in <i>hours:minutes:seconds</i> format.</p> |
| <b>Command Modes</b>      | Global Configuration (config)                     |  |
| <b>Command Default</b>    | None  |  |

## Example

```
Device#configure terminal
Device(config)#time-range days
Device(config-timerange-days)#periodic daily 04:50:30 to 09:50:40
```

# preemption-time

To configure the recovery time to switch to the primary server, use the **preemption-time** command in AAA configuration mode.

**preemption-time** *time*

| <b>Syntax Description</b> | <i>time</i>  | The preemption time<br>The unit in minutes.<br>The range is from 0 to 1440. The default value isc0 |         |             |            |                               |
|---------------------------|--|--|---------|-------------|------------|-------------------------------|
| <b>Command Modes</b>      | AAA configuration (config-aaa)   |  |         |             |            |                               |
| <b>Usage Guidelines</b>   | Use this command in the AAA configuration mode.  |  |         |             |            |                               |
| <b>Examples</b>           | This example shows how to configure the recovery time to switch to the primary server.   |  |         |             |            |                               |
|                           | <pre>Device&gt; enable Device# configure terminal Device(config)# aaa Device(config-aaa)# radius host radius1 Device(config-aaa-radius-radius1)# preemption-time 200</pre>           |  |         |             |            |                               |
| <b>Related Commands</b>   | <table border="1"> <thead> <tr> <th>Command</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><b>aaa</b></td> <td>Enters AAA configuration mode</td> </tr> </tbody> </table> |  | Command | Description | <b>aaa</b> | Enters AAA configuration mode |
| Command                   | Description  |  |         |             |            |                               |
| <b>aaa</b>                | Enters AAA configuration mode  |  |         |             |            |                               |

{primary-acct-ip | second-acct-ip}

# {primary-acct-ip | second-acct-ip}

To configure the primary and secondary accounting servers, use the {primary-acct-ip |second-acct-ip} *ip\_address port* command in AAA configuration mode. To disable the configured primary and secondary accounting servers, use the **no** form of the command.

**{primary-acct-ip | second-acct-ip}** *ip\_address port*

**no {primary-acct-ip | second-acct-ip}**

|                           |                        |                                  |
|---------------------------|------------------------|----------------------------------|
| <b>Syntax Description</b> | <b>primary-acct-ip</b> | The primary accounting server.   |
|                           | <b>second-acct-ip</b>  | The secondary accounting server. |
|                           | <i>ip_address</i>      | The IP address of the server.    |
|                           | <i>port</i>            | The accounting port              |
|                           |                        | The range is from 1 to 65535.    |

**Command Modes** AAA configuration (config-aaa)

## Examples

This example shows how to configure the primary and secondary accounting server.

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius host radius1
Device(config-aaa-radius-radius1)# primary-acct-ip 10.1.1.10 333
Device(config-aaa-radius-radius1)# second-acct-ip 10.1.1.11 350
```

# {primary-auth-ip | second-auth-ip}

To configure the primary and secondary RADIUS servers, use the {primary-auth-ip |second-auth-ip} *ip\_address port* command in AAA configuration mode. To disable the configured primary and secondary RADIUS servers, use the **no** form of the command.

**{primary-auth-ip | second-auth-ip}** *ip\_address port*

**no {primary-auth-ip | second-auth-ip}**

|                           |                        |  |
|---------------------------|------------------------|--|
| <b>Syntax Description</b> | <b>primary-auth-ip</b> | The primary RADIUS server.                       |
|                           | <b>second-auth-ip</b>  | The secondary RADIUS server.                     |
|                           | <i>ip_address</i>      | The IP address of the server.                    |
|                           | <i>port</i>            | The server port<br>The range is from 1 to 65535. |

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                                |

| <b>Examples</b> | This example shows how to configure the primary and secondary accounting server |
|-----------------|---|

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius host radius1
Device(config-aaa-radius-radius1)# primary-auth-ip 10.2.1.10 80
Device(config-aaa-radius-radius1)# second-auth-ip 10.2.1.11 90
```

# radius

To configure the RADIUS server parameters, use the **radius** command in AAA configuration mode. To restore the default RADIUS server settings, use the **no** version of the command.

```
radius {8021p enable | accounting | attribute client-version | bandwidth-limit enable |
config-attribute {access-bandwidth {downlink vendor-type | unit {bps | kbps} |
uplink vendor-type} | dscp vendor-type | mac-address-number vendor-type} | host host-name |
mac-address-number enable | server-disconnect drop1x | vlan enable}

no radius {8021p | accounting | attribute client-version | bandwidth-limit enable | host
host-name | mac-address-number | server-disconnect drop1x | vlan}
```

| Syntax Description                         |  |  |
|--|--|--|
| <b>8021p enable</b>                        |  | Configures RADIUS to distribute port priority.                                     |
| <b>accounting</b>                          |  | Enables accounting function.   |
| <b>attribute client-version</b>            |  | Send the H3C client's version to radius server.                                    |
| <b>bandwidth limit-enable</b>              |  | Configures RADIUS to distribute bandwidth limit.                                   |
| <b>config-attribute</b>                    |  | Configures the RADIUS attribute type and attributes.                               |
| <b>access-bandwidth</b>                    |  | Configures the RADIUS access bandwidth.  |
| <b>downlink</b>                            |  | Configures the RADIUS downlink attributes.   |
| <b>uplink</b>                              |  | Configures the RADIUS uplink attributes.   |
| <b>unit bps</b>                            |  | Configures the RADIUS ACL bandwidth per second.                                    |
| <b>unit kbps</b>                           |  | Configures the RADIUS ACL bandwidth in kilobits per second.                        |
| <b>dscp</b>                                |  | Configures the RADIUS DSCP attributes.   |
| <b>config-attribute mac-address-number</b> |  | Configures the maximum MAC address learned for the RADIUS server.                  |
| <b>vendor-type</b>                         |  | The vendor type.<br>The range is from 1 to 500.                                    |
| <b>mac-address-number enable</b>           |  | Configures RADIUS to distribute number of MAC addresses.                           |
| <b>host host-name</b>                      |  | Creates a RADIUS scheme and enters configuration mode for the specified host name. |
| <b>server-disconnect drop1x</b>            |  | Configures the device to shut the user accounting packet does not respond.         |

---

**vlan enable** Configures RADIUS to distribute

**Command Modes** AAA configuration (config-aaa)

### Example

This example shows how to configure RADIUS to distribute port priority:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius 8021p enable
Configure successfully.
```

### Example

This example shows how to enable accounting function:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius accounting
Modify accounting configuration of radius server successfully.
```

### Example

This example shows how to send the H3C client's version to radius server:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius attribute client-version
Device(config-aaa)#

```

### Example

This example shows how to configure RADIUS to distribute bandwidth control:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius bandwidth limit-enable
Configure successfully.
```

### Example

This example shows how to configure the RADIUS access bandwidth and downlink attribute:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius config-attribute access-bandwidth downlink 400
Configure successfully.
```

**Example**

This example shows how to configure the RADIUS DSCP attribute:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius config-attribute dscp 1
Configure successfully.
```

**Example**

This example shows how to create a RADIUS scheme and enters RADIUS scheme mode:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius host hostname1
Device(config-aaa-radius-hostname1) #
```

**Example**

This example shows how to configure RADIUS to distribute number limit of MAC address:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius mac-address-number enable
Configure successfully.
```

**Example**

This example shows how to shut the user down if the accounting packet does not respond:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius server-disconnect drop 1x
Configure successfully.
```

**Example**

This example shows how to configure RADIUS to distribute port PVID:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius vlan enable
Configure successfully.
```

# realtime-account

To configure realtime accounting and its time interval, use the **realtime-account** command in AAA configuration mode. To disable realtime accounting, use the **no** form of the command.

**realtime-accountinterval*time***

**no realtime-account**

| Syntax Description |                             |  |
|--------------------|-----------------------------|--|
|                    | <b>interval <i>time</i></b> | Configures the realtime accounting interval.<br>The range is 1 to 255 minutes. |

| Command Modes | AAA configuration (config-aaa) |
|---------------|--------------------------------|
|---------------|--------------------------------|

## Example

This example shows how to configure real time accounting using the **realtime-account** command:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius host radius1
Device(config-aaa-radius-radius1)# realtime-account interval 25
    Modify realtime_acct configuration of radius server successfully.
```

**no access-list**

## no access-list

To remove an entry or all entries from the Access Control List (ACL), use the **no access-list** command in the global configuration mode.

```
no access-list {number| name |all}
```

**Syntax Description**

**number** Specifies that numbered ACL to delete

**name** Specifies the name of the ACL to delete.

**Command Default**

None

**Command Modes**

Global configuration (config)

**Example**

```
Device#configure terminal  
Device(config)#no access-list 10
```

# scheme

To configure the server authentication scheme, use the **scheme** command in AAA configuration mode.

**scheme {local | radius [local]}**

|                           |  |  |
|---------------------------|--|--|
| <b>Syntax Description</b> |  |  |
| <b>local</b>              |  | Configures to use local user authen-                                 |
| <b>radius</b>             |  | Configures to use RADIUS server                                      |
| <b>radius local</b>       |  | Configures to use local user authen-<br>server authentication fails. |

|                      |                                |
|----------------------|--------------------------------|
| <b>Command Modes</b> | AAA configuration (config-aaa) |
|----------------------|--------------------------------|

## Example

This example shows how to configure a server authentication scheme using the **scheme** command:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# domain eee
Device(config-aaa-domain-eee)# scheme radius
Device(config-aaa-domain-eee)#
Device>
```

show access-list config

## show access-list config

To display the Access Controlled List (ACL) configurations, use the **show access-list config** command in the EXEC mode

**show access-list config {number | all | name | statistic }**

|                           |  |   |
|---------------------------|--|---|
| <b>Syntax Description</b> | <b>number</b><br><b>all</b><br><b>name</b><br><b>statistic</b> | Specifies the numbered ACL.<br>Numbers 1 to 99 represent standard ACLs.<br>Numbers 100 to 199 represent extended ACLs.<br>Numbers 200 to 299 represent Layer 2 ACLs.<br>Specifies all ACLs.<br>Specifies an ACL by name.<br>Specifies ACL statistics. |
|---------------------------|--|---|

**Command Modes** EXEC

**Command Default** None

**Usage Guidelines** Use the **show access-list config statistic** command to see the statistics of the ACL rules usage.  
 Use the **show access-list config name** command to see the ACL specified by name.  
 Use the **show access-list config all** command to see all the ACLs.

### Examples

```
Device> enable
Device# show access-list config 1
Standard IP Access List 1, match-order is config, 2 rule:
  0 deny    any
  permit  1.1.1.1  0.0.0.0
```

# show access-list runtime

To display the Access Controlled List (ACL) at run time, use the **show access-list runtime** command in the EXEC mode

**show access-list runtime {number | all | name | statistic}**

|                           |   |   |
|---------------------------|---|---|
| <b>Syntax Description</b> | <b>number</b><br><b>all</b><br><b>name</b><br><b>statistic</b>  | Specifies the numbered ACL.<br>Numbers 1 to 99 represent standard ACLs.<br>Numbers 100 to 199 represent extended ACLs.<br>Numbers 200 to 299 represent Layer 2 ACLs.<br>Specifies all ACLs.<br>Specifies an ACL by name.<br>Specifies ACL statistics. |
| <b>Command Modes</b>      | EXEC  |   |
| <b>Command Default</b>    | None  |   |
| <b>Usage Guidelines</b>   | Use the <b>show access-list runtime statistic</b> command to see the statistics of the ACL rules usage.<br>Use the <b>show access-list runtime name</b> command to see the ACL specified by name.<br>Use the <b>show access-list runtime all</b> command to see all the ACLs. |   |

## Examples

```
Device> enable
Device# show access-list runtime 1
Standard IP Access List 1, match-order is config, 1 rule:
  0  deny      any
```

**show anti-dos**

# show anti-dos

To display the anti-DDOS configuration information, use the **show anti-dos** command in privileged EXEC or global configuration modes.

## show anti-dos

---

**Command Modes**

Privileged EXEC (#)  
Global Configuration (config)

### Example

This example shows a sample output for the **show anti-dos** command:

```
Device> enable
Device# configure terminal
Device(config)# show anti-dos
Informations of AntiDos:
Ip fragment max number:800
Ip fragment number now:0
TTL=0 packet traffic to CPU is disable.
```

# show arp anti-flood

To display the ARP anti-flood configuration and attackers list, use the **show arp anti-flood** command in privileged EXEC or global configuration modes.

**show arp anti-floodport-threshold [ { ethernet | gpon } slot-number/port-number [to { ethernet | gpon } slot-number/port-number] ]**

## Syntax Description

|                                |   |
|--------------------------------|---|
| <i>slot-number/port-number</i> | The port ID. <ul style="list-style-type: none"><li>• <i>slot-number</i>:<ul style="list-style-type: none"><li>• GPON: The value is 0.</li><li>• GE Ethernet: The value</li><li>• 10GE Ethernet: The val</li></ul></li><li>• <i>port-number</i>:<ul style="list-style-type: none"><li>• GPON: The range is fro</li><li>• GE Ethernet: The range</li><li>• 10GE Ethernet: The ran</li></ul></li></ul> |
| <b>to</b>                      | Displays the information for a range of ports. When you use the <b>to</b> keyword, specify the same port number for both ends of the range.   |

## Command Modes

Privileged EXEC (#)  
Global Configuration (config)

## Example

This example shows a sample output for the **show arp anti-flood** command:

```
Device> enable
Device# configure terminal
Device(config)# show arp anti-flood
Arp anti-flood: disabled
Arp rate limit:25pps
User recovery time:234 minutes
Reject type:DenyAll
DeniedSrcMAC      SourceIP          Port      Vlan DenyType  RemainAgingTime (m)
Total entry:0.
```

## Example

This example shows a sample output for the **show arp anti-flood port-threshold** command:

```
show arp anti-flood
```

```
Device> enable
Device# configure terminal
Device(config)# show arp anti-flood port-threshold
Arp anti-flood: disabled
Arp rate limit:25pps
User recovery time:234 minutes
Reject type:DenyAll
Port          Port-threshold
g0/1          16
g0/2          16
g0/3          16
g0/4          16
g0/5          16
g0/6          16
g0/7          16
g0/8          16
e1/1          16
e1/2          16
e1/3          16
e1/4          16
e2/1          16
e2/2          16
```

# show arp anti interface

To display the state of the interface, use the **show arp anti interface** command in privileged EXEC or global configuration modes.

**show arp anti interface** [**{ ethernet | gpon }** *slot-number/port-number*]

|                           |                                |  |
|---------------------------|--------------------------------|--|
| <b>Syntax Description</b> | <i>slot-number/port-number</i> | The port ID. <ul style="list-style-type: none"> <li>• <i>slot-number</i>:</li> <li>• GPON: The value is 0.</li> <li>• GE Ethernet: The value ranges from 1 to 8.</li> <li>• 10GE Ethernet: The value ranges from 1 to 2.</li> </ul> <ul style="list-style-type: none"> <li>• <i>port-number</i>:</li> <li>• GPON: The range is from 1 to 8.</li> <li>• GE Ethernet: The range is from 1 to 8.</li> <li>• 10GE Ethernet: The range is from 1 to 2.</li> </ul> |
|---------------------------|--------------------------------|--|

|                      |  |
|----------------------|--|
| <b>Command Modes</b> | Privileged EXEC (#)<br>Global Configuration (config) |
|----------------------|--|

## Example

This example shows a sample output for the **show arp anti interface** command:

```
Device> enable
Device# configure terminal
Device(config)# show arp anti interface
Port      mode      threshold(anti-flood)
g0/1      untrust   -
g0/2      untrust   -
g0/3      untrust   -
g0/4      untrust   -
g0/5      untrust   -
g0/6      untrust   -
g0/7      untrust   -
g0/8      untrust   -
e1/1      untrust   -
e1/2      untrust   -
e1/3      untrust   -
e1/4      untrust   -
e2/1      untrust   -
e2/2      untrust   -
```

**show cpu-car**

## show cpu-car

To display the CPU-car performance, use the **show cpu-car** command in privileged EXEC or global configuration modes.

**show cpu-car****Command Modes**

Privileged EXEC (#)  
Global Configuration (config)

**Example**

This example shows a sample output for the **show cpu-car** command:

```
Device> enable
Device# configure terminal
Device(config)# show cpu-car
Send packet to cpu rate = 4000 pps.
```

# show cpu-classification

To display CPU receiving packet classification statistics, run the **show cpu-classification** command in privileged EXEC or global configuration modes.

**show cpu-classification [interface {ethernet | gpon}slot-number/port-number]**

|                           |  |   |
|---------------------------|--|---|
| <b>Syntax Description</b> | <i>slot-number/port-number</i>                     | The port ID.<br><ul style="list-style-type: none"> <li>• <i>slot-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The value is 0.</li> <li>• GE Ethernet: The value is 1.</li> <li>• 10GE Ethernet: The value is 2.</li> </ul> </li> <li>• <i>port-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The range is from 1 to 16.</li> <li>• GE Ethernet: The range is from 1 to 48.</li> <li>• 10GE Ethernet: The range is from 1 to 16.</li> </ul> </li> </ul> |
| <b>Command Default</b>    | None   |   |
| <b>Command Modes</b>      | Privileged EXEC(#)<br>Global Configuration(config) |   |

## Examples

This example shows how to view CPU receiving packet classification statistics.

```
Device> enable
Device# configure terminal
Device(config)# show cpu-classification
Type      Count      Percent(%)
Total     460699064   100
          8237424      1
          378164060    82
          607189        0
          699125        0
          0              0
          139            0
          12658100      2
          4079818       0
          122166        0
          10788         0
          56120236      12
```

**show cpu-limit**

## show cpu-limit

To display the packet types and the speed of each packet type, use the **show cpu-limit** command in privileged EXEC or global configuration modes.

**show cpu-limit**

---

|                      |  |
|----------------------|--|
| <b>Command Modes</b> | Privileged EXEC (#)<br>Global Configuration (config) |
|----------------------|--|

### Example

This example shows a sample output for the **show cpu-limit** command:

```
Device> enable
Device# configure terminal
Device(config)# show cpu-limit
packet-type      speed(pps)
other            200
broadcast        200
switch-dst-mac   1000
icmp             200
mld              200
igmp             200
ssh              200
dhcp             200
snmp             100
arp               100
ospf              200
rip               200
telnet            100
bpdu              200
```

# show cpu-statistics

To display CPU receiving packet port statistics, use the **show cpu-statistics** command in privileged EXEC and global configuration modes.

```
show cpu-statistics [channel-group channel-group-number | {gpon | ethernet} slot-number/port-number] [to {channel-group channel-group-number | {gpon | ethernet} slot-number/port-number}]
```

## Syntax Description

|                                |                             |  |
|--------------------------------|-----------------------------|--|
| <b>channel-group</b>           | <i>channel-group-number</i> | The LACP channel group.  |
| <b>slot-number/port-number</b> |                             | The port ID.   |
|                                |                             | <ul style="list-style-type: none"> <li>• <i>slot-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The value is 0.</li> <li>• GE Ethernet: The value is 1.</li> <li>• 10GE Ethernet: The value is 10.</li> </ul> </li> <br/> <li>• <i>port-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The range is from 1 to 16.</li> <li>• GE Ethernet: The range is from 1 to 48.</li> <li>• 10GE Ethernet: The range is from 1 to 10.</li> </ul> </li> </ul> |
| <b>to</b>                      |                             | Displays the information for a range of ports. It is placed between two port numbers of the same port type before and after the range separator (e.g., 1/1-1/16).  |

## Command Default

None

## Command Modes

Privileged EXEC (#)  
Global configuration (config)

## Examples

This example shows how to view CPU receiving packet port statistics.

```
Device> enable
Device# configure terminal
Device(config)# show cpu-statistics ethernet 1/1
Show packets sent to cpu statistic information
port 64Byte 128Byte 256Byte 512Byte 1024Byte 2048Byte
e1/1 0 0 0 0 0 0
```

**show cpu-utilization**

# show cpu-utilization

To display CPU utilization, use the **show cpu-utilization** command in global configuration mode.

## show cpu-utilization

|                        |   |
|------------------------|---|
| <b>Command Default</b> | None  |
| <b>Command Modes</b>   | Global configuration (config)                   |
| <b>Examples</b>        | This example shows how to view CPU utilization. |

```
Device> enable
Device# configure terminal
Device(config)# show cpu-utilization
CPU Information:
CPU Idle : 79 %
```

# show dhcp anti-attack

To display the DHCP anti-attack configuration, use the **show dhcp anti-attack** command in privileged EXEC and global configuration modes.

```
show dhcp anti-attack [interface {ethernet | gpon} slot-number/port-number [to {ethernet | gpon} slot-number/port-number] ]
```

## Syntax Description

|                                |   |
|--------------------------------|---|
| <b>to</b>                      | Displays the information for a range of ports. If you use the <b>to</b> keyword, specify the same port number for both the <b>slot-number</b> and <b>port-number</b> parameters.  |
| <i>slot-number/port-number</i> | <p>The port ID.</p> <ul style="list-style-type: none"> <li>• <i>slot-number</i>:</li> <ul style="list-style-type: none"> <li>• GPON: The value is 0.</li> <li>• GE Ethernet: The value is 1.</li> <li>• 10GE Ethernet: The value is 2.</li> </ul> <li>• <i>port-number</i>:</li> <ul style="list-style-type: none"> <li>• GPON: The range is from 0 to 31.</li> <li>• GE Ethernet: The range is from 1 to 31.</li> <li>• 10GE Ethernet: The range is from 1 to 31.</li> </ul> </ul> |

## Command Modes

Privileged EXEC (#)  
Global Configuration (config)

## Example

This example shows a sample output for the **show dhcp anti-attack** command:

```
Device> enable
Device# configure terminal
Device(config)# show dhcp anti-attack
Dhcp anti-attack: enabled
Dhcp rate limit:1pps
User recovery time:3 minutes
Reject type:DenyDHCP
DeniedSrcMAC Port Vlan DenyType RemainAgingTime(m)
00:00:00:01:11:23 e1/1 2 DenyDHCP 3
Total entry: 1.
#After 3 minutes, the attack entry is aged out
```

**show discard-bpdu**

## show discard-bpdu

To display the BPDU status, use the **show discard-bpdu** command in privileged EXEC and global configuration modes.

### show discard-bpdu

**Command Modes**

Privileged EXEC (#)  
Global Configuration (config)

**Example**

This example shows a sample output for the **show discard-bpdu** command:

```
Device> enable
Device# configure terminal
Device(config)# show discard-bpdu
Discard BPDU global status: disable
Discard BPDU enable port:
```

Notes: Once global status is on, the switch will discard all BPDUs.  
If want to enable on some ports only, need to disable global function and choose another commands.

# show dot1x

To display the 802.1x authentication function details, run the **show dot1x** command in privileged EXEC and global configuration modes.

```
show dot1x [[daemon | detect | eapol-relay | guest-vlan] [interface {ethernet | gpon}
slot-number/port-number] [to {ethernet | gpon} slot-number/port-number] | max-reauth |
max-req | port-auth | quiet-period-value | session [interface {ethernet | gpon}
slot-number/port-number [to {ethernet | gpon} slot-number/port-number] | mac-address
mac-address-value]]
```

| Syntax Description             |  |   |
|--------------------------------|--|---|
| <b>daemon</b>                  |  | Displays the configuration of 802.1x interface watch function.  |
| <b>detect</b>                  |  | Displays heartbeat detection configuration.   |
| <b>eapol-relay</b>             |  | Displays EAPOL pass through configuration.  |
| <b>guest-vlan</b>              |  | Displays guest VLAN information.  |
| <b>interface</b>               |  | Displays interface configuration, security control mode, re-authentication status, and number of users for the interface authentication.  |
| <i>slot-number/port-number</i> |  | The port ID. <ul style="list-style-type: none"> <li>• <i>slot-number</i>: <ul style="list-style-type: none"> <li>• GPON: The value is 0.</li> <li>• GE Ethernet: The value is 1.</li> <li>• 10GE Ethernet: The value is 2.</li> </ul> </li> <li>• <i>port-number</i>: <ul style="list-style-type: none"> <li>• GPON: The range is from 1 to 4.</li> <li>• GE Ethernet: The range is from 1 to 4.</li> <li>• 10GE Ethernet: The range is from 1 to 4.</li> </ul> </li> </ul> |
| <b>to</b>                      |  | Displays the information for a range of ports. To use the <b>to</b> keyword, specify the same port number for both the <b>from</b> and <b>to</b> keywords.  |
| <b>max-reauth</b>              |  | Displays information about maximum re-authentication requests and identity packets sent by the server.  |
| <b>max-req</b>                 |  | Displays information about the maximum number of re-authentication requests sent by the server.   |

**show dot1x**

|   |   |
|---|---|
| <b>port-auth</b>                            | Displays whether the interface authenticates or disabled. |
| <b>quiet-period-value</b>                   | Displays the quiet period.                                |
| <b>session</b>                              | Displays 802.1x session.                                  |
| <b>mac-address</b> <i>mac-address-value</i> | Displays 802.1x session information for address.          |

#### Command Modes

Privileged EXEC (#)  
Global Configuration (config)

#### Example

This example shows the sample output for the **show dot1x daemon**

```
Device> enable
Device# configure terminal
Device(config)# show dot1x daemon
port    daemonstatus   daemontime(s)
g0/1    close          60
g0/2    close          60
g0/3    close          60
g0/4    close          60
g0/5    close          60
g0/6    close          60
g0/7    close          60
g0/8    close          60
e1/1    close          60
e1/2    close          60
e1/3    close          60
e1/4    close          60
e2/1    close          60
e2/2    close          60
```

#### Example

This example shows the sample output for the **show dot1x detect**

```
Device> enable
Device# configure terminal
Device(config)# show dot1x detect
the user detect interval is 25
port : detect
g0/1 : disable
g0/2 : disable
g0/3 : disable
g0/4 : disable
g0/5 : disable
g0/6 : disable
g0/7 : disable
g0/8 : disable
e1/1 : disable
e1/2 : disable
e1/3 : disable
e1/4 : disable
e2/1 : disable
```

```
e2/2 : disable
Total [14] item(s), printed [14] item(s).
```

### Example

This example shows the sample output for the **show dot1x eapol-relay**

```
Device> enable
Device# configure terminal
Device(config)# show dot1x eapol-relay
Port EapolRelay EapolRelayUplink
g0/1 disabled false
g0/2 disabled false
g0/3 disabled false
g0/4 disabled false
g0/5 disabled false
g0/6 disabled false
g0/7 disabled false
g0/8 disabled false
e1/1 disabled false
e1/2 disabled false
e1/3 disabled false
e1/4 disabled false
e2/1 disabled false
e2/2 disabled false

Total entries: 14.
```

### Example

This example shows the sample output for the **show dot1x guest-vlan**

```
Device> enable
Device# configure terminal
Device(config)# show dot1x guest-vlan
Port GuestVlan Status
g0/1 disable InConfigVlan
g0/2 disable InConfigVlan
g0/3 disable InConfigVlan
g0/4 disable InConfigVlan
g0/5 disable InConfigVlan
g0/6 disable InConfigVlan
g0/7 disable InConfigVlan
g0/8 disable InConfigVlan
e1/1 44 InConfigVlan
e1/2 disable InConfigVlan
e1/3 disable InConfigVlan
e1/4 disable InConfigVlan
e2/1 disable InConfigVlan
e2/2 disable InConfigVlan
```

```
Total entries: 14.
```

### Example

This example shows the sample output for the **show dot1x interface**

**show dot1x**

```
Device> enable
Device# configure terminal
Device(config)# show dot1x interface ethernet 1/3
Authentication of system: disabled
Type of authentication: eap-finish

Total [0] item(s).
```

**Example**

This example shows the sample output for the **show dot1x max-reauth**

```
Device> enable
Device# configure terminal
Device(config)# show dot1x max-reauth
the max-reauth is 2.
```

**Example**

This example shows the sample output for the **show dot1x max-req**

```
Device> enable
Device# configure terminal
Device(config)# show dot1x max-req
the max-req is 2.
```

**Example**

This example shows the sample output for the **show dot1x port-auth**

```
Device> enable
Device# configure terminal
Device(config)# show dot1x port-auth
-----
port 1 auth is close
port 2 auth is close
port 3 auth is close
port 4 auth is close
port 5 auth is close
port 6 auth is close
port 7 auth is close
port 8 auth is close
port 9 auth is close
port 10 auth is close
port 11 auth is close
port 12 auth is close
port 13 auth is close
port 14 auth is close
-----
```

**Example**

This example shows the sample output for the **show dot1x quiet-period-value**

```
Device> enable
Device# configure terminal
```

```
Device(config)# show dot1x quiet-period-value  
the quiet-period-value is 0.
```

### Example

This example shows the sample output for the **show dot1x session**

```
Device> enable  
Device# configure terminal  
Device(config)# show dot1x session  
Total [0] item(s).
```

**show ip route**

# show ip route

To display the related information of specified routes as well as static routes, use the **show ip route** command in privileged EXEC and global configuration modes.

**show ip route [ip-address [mask] | ospf | rip | static]**

|                           |                   |  |
|---------------------------|-------------------|--|
| <b>Syntax Description</b> |                   |  |
|                           | <i>ip-address</i> | The destination address.                   |
|                           | <i>mask</i>       | The destination network segment presented. |
|                           | <b>ospf</b>       | Displays all OSPF routes.                  |
|                           | <b>rip</b>        | Displays all RIP routes.                   |
|                           | <b>static</b>     | Displays all static routes.                |

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Privileged EXEC (#)           |
|                      | Global Configuration (config) |

## Example

This example shows a sample output for the **show ip route** command:

```
Device> enable
Device# configure terminal
Device(config)# show ip route
Show ip route information

INET route table - vr: 0, table: 254
Route flag: U - up, G - gateway, H - host, R - reject, C - clone, S - static
Destination      Gateway          Flags    Use   Interface     Proto
0.0.0.0/0        10.75.171.1    UGS      659   VLAN-IF100   static

# show shutdown-control interface

To display the shutdown configuration, use the **show shutdown-control interface** command in privileged EXEC or global configuration mode.

**show shutdown-control interface [ethernet slot-number/port-number [to ethernet slot-number/port-number]]**

## Syntax Description

|                                |   |
|--------------------------------|---|
| <i>slot-number/port-number</i> | The port ID. <ul style="list-style-type: none"> <li>• <i>slot-number</i>:</li> <li>• GPON: The value is 0.</li> <li>• GE Ethernet: The value</li> <li>• 10GE Ethernet: The val</li> </ul>   |
| <b>to</b>                      | • <i>port-number</i> : <ul style="list-style-type: none"> <li>• GPON: The range is fro</li> <li>• GE Ethernet: The range</li> <li>• 10GE Ethernet: The ran</li> </ul> Displays the information for a ran<br>the <b>to</b> keyword, specify the same p<br>the keyword. |

## Command Modes

Privileged EXEC (#)  
Global Configuration (config)

## Example

This example shows a sample output for the **show shutdown-control interface** command:

```
Device> enable
Device# configure terminal
Device(config)# show shutdown-control interface
port shutdown control recover mode : manual
port shutdown control information :
PortID Broadcast Broadcast Multicast Multicast Unicast Unicast
      status   value     status   value     status   value
e1/1    disable    -    disable    -    disable    -
e1/2    disable    -    disable    -    disable    -
e1/3    disable    -    disable    -    disable    -
e1/4    disable    -    disable    -    disable    -
e2/1    disable    -    disable    -    disable    -
e2/2    disable    -    disable    -    disable    -
Total entries: 6 .
```

show spanning-tree interface

# show spanning-tree interface

To display the spanning tree configuration parameters, use the **show spanning-tree interface** command in the privileged EXEC and global configuration modes.

```
show spanning-tree interface [brief] {ethernet | gpon} slot-number/port-number [to {ethernet | gpon} slot-number/port-number]
```

|                           |  |  |
|---------------------------|--|--|
| <b>Syntax Description</b> | <i>slot-number/port-number</i>                       | The port ID.   |
|                           |  | <ul style="list-style-type: none"> <li>• <i>slot-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The value is 0.</li> <li>• GE Ethernet: The value is 1.</li> <li>• 10GE Ethernet: The value is 2.</li> </ul> </li> <li>• <i>port-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The range is from 1 to 16.</li> <li>• GE Ethernet: The range is from 1 to 48.</li> <li>• 10GE Ethernet: The range is from 1 to 8.</li> </ul> </li> </ul> |
| <b>to</b>                 |  | Displays the information for a range of ports. To display the information for a range of ports, after the <b>to</b> keyword, specify the same port type as the <b>slot-number</b> keyword.   |
| <b>Command Modes</b>      | Privileged EXEC (#)<br>Global Configuration (config) |  |

## Example

This example shows a sample output for the **show spanning-tree interface** command:

```
Device> enable
Device# configure terminal
Device(config)# show spanning-tree interface
Port g0/1 of bridge is Forwarding
  Spanning tree protocol is enabled
Port g0/2 of bridge is DOWN
  Spanning tree protocol is enabled
Port g0/3 of bridge is DOWN
  Spanning tree protocol is enabled
Port g0/4 of bridge is DOWN
  Spanning tree protocol is enabled
Port g0/5 of bridge is DOWN
  Spanning tree protocol is enabled
Port g0/6 of bridge is DOWN
  Spanning tree protocol is enabled
Port g0/7 of bridge is DOWN
  Spanning tree protocol is enabled
```

```
Port g0/8 of bridge is DOWN
    Spanning tree protocol is enabled
Port e1/1 of bridge is DOWN
    Spanning tree protocol is enabled
Port e1/2 of bridge is DOWN
    Spanning tree protocol is enabled
Port e1/3 of bridge is Forwarding
    Spanning tree protocol is enabled
Port e1/4 of bridge is DOWN
    Spanning tree protocol is enabled
Port e2/1 of bridge is DOWN
    Spanning tree protocol is enabled
Port e2/2 of bridge is DOWN
    Spanning tree protocol is enabled
```

# shutdown-control-recover

To enable the port recovery mode and configure the port recovery parameters, use the **shutdown-control-recover** command in global configuration mode. To disable the port recovery mode and restore the default parameter values, use the **no** form of the command.

**shutdown-control-recover {automatic-open-time *open-time* | mode {automatic | manual}}**

**no shutdown-control-recover {automatic-open-time | mode}**

|                           |  |   |
|---------------------------|--|---|
| <b>Syntax Description</b> | <b>automatic-open-time <i>open-time</i></b><br><b>mode automatic</b><br><b>mode manual</b> | Configures the time after which the port recovery time is expires.<br>Enables automatic recovery mode.<br>Enables manual recovery mode. |
| <b>Command Modes</b>      | Global Configuration (config)  |   |

## Example

This example shows how to configure automatic recovery mode on a port using the **shutdown-control-recover** command:

```
Device> enable
Device# configure terminal
Device(config)# shutdown-control-recover mode automatic
Device(config)#

```

# spanning-tree (global configuration)

To enable spanning tree globally and configure the spanning tree parameters, use the **spanning-tree** command in global configuration mode. To disable spanning tree, use the **no** form of the command.

```
spanning-tree [forward-time delay-time | hello-time hello-time | max-age age-time | mode {rstp | stp} | pathcost-standard {dot1d-1998 | dot1t} | priority priority-value | root-guard action {block-port | drop-packets}]
```

```
no spanning-tree [forward-time | hello-time | max-age | mode | pathcost-standard | priority | root-guard action]
```

| Syntax Description |                                       |  |
|--------------------|---------------------------------------|--|
|                    | <b>forward-time</b> <i>delay-time</i> | Configures the forwarding delay of the system.<br>The range is 4 to 30 seconds.                            |
|                    | <b>hello-time</b> <i>hello-time</i>   | Configures the hello message time interval.<br>The range is 1 to 10 seconds.                               |
|                    | <b>max-age</b> <i>age-time</i>        | Configures the aging time of the spanning tree.<br>The range is 6 to 40 seconds.                           |
|                    | <b>mode rstp</b>                      | Configures the RSTP spanning tree.   |
|                    | <b>mode stp</b>                       | Configures the STP spanning tree.  |
|                    | <b>pathcost-standard dot1d-1998</b>   | Sets pathcost standard for dot1d-1998.   |
|                    | <b>pathcost-standard dot1t</b>        | Sets pathcost standard for dot1t.  |
|                    | <b>priority</b> <i>priority-value</i> | Configures the switch priority.<br>The range is from 0 to 61440, in steps of 1.                            |
|                    | <b>root-guard action block-port</b>   | Enables root protection globally.<br>BPDU configuration messages are dropped if packets are not forwarded. |
|                    | <b>root-guard action drop-packets</b> | Enables root protection globally.<br>BPDU configuration messages are dropped if packets are forwarded.     |

## Command Modes

Global configuration (config)

## Example

This example shows how to configure the forwarding delay of the system:

```
Device> enable
Device# configure terminal
```

**spanning-tree (global configuration)**

```
Device(config)# spanning-tree forward-time 10
Device(config)#End
```

**Example**

This example shows how to configure the hello message time interval:

```
Device> enable
Device# configure terminal
Device(config)# spanning-tree hello-time 5
Device(config)#End
```

**Example**

This example shows how to configure the aging time of the system:

```
Device> enable
Device# configure terminal
Device(config)# spanning-tree max-age 10
Device(config)#End
```

**Example**

This example shows how to configure RSTP spanning tree mode:

```
Device> enable
Device# configure terminal
Device(config)# spanning-tree mode rstp
Device(config)#End
```

**Example**

This example shows how to configure STP spanning tree mode:

```
Device> enable
Device# configure terminal
Device(config)# spanning-tree mode stp
Device(config)#End
```

**Example**

This example shows how to configure the pathcost standard:

```
Device> enable
Device# configure terminal
Device(config)# spanning-tree pathcost-standard dot1t
Device(config)#End
```

**Example**

This example shows how to configure the switch priority:

```
Device> enable
Device# configure terminal
```

```
Device(config)# spanning-tree priority 3
Device(config)#
```

### Example

This example shows how to enable root guard protection globally and configure the data packets to not be forwarded:

```
Device> enable
Device# configure terminal
Device(config)# spanning-tree root-guard action block-port
Device(config)#
```

# spanning-tree (interface configuration)

To enable spanning tree on a specific interface and configure the spanning tree parameters, use the **spanning-tree** command in interface configuration mode. To disable spanning tree, use the **no** form of the command.

```
spanning-tree [cost cost-value | loop-guard | mcheck | point-to-point {auto | forcefalse | forcetrue} | port-priority priority-value | portfast | root-guard | transit-limit value]
```

```
no spanning-tree [cost | loop-guard | point-to-point | port-priority | portfast | root-guard | transit-limit ]
```

| Syntax Description                         |  |                              |
|--|--|------------------------------|
| <b>cost</b> <i>cost-value</i>              | Modifies the path cost of the STP port.                          | The range is 1 to 200000000. |
| <b>loop-guard</b>                          | Enables loop-guard on the port.                                  |                              |
| <b>mcheck</b>                              | Configures Mcheck on the port.                                   |                              |
| <b>point-to-point auto</b>                 | STP decides the point to point link.                             |                              |
| <b>point-to-point forcetrue</b>            | Enables the point to point link.                                 |                              |
| <b>point-to-point forcefalse</b>           | Disables the point to point link.                                |                              |
| <b>port-priority</b> <i>priority-value</i> | Configures the STP priority of the port.                         | The range is 0 to 240.       |
| <b>portfast</b>                            | Configures the port as an edge port.                             |                              |
| <b>root-guard</b>                          | Enables root protection locally on the port.                     |                              |
| <b>transit-limit</b> <i>value</i>          | Configures the port to send the maximum number of BPDU messages. | The range is 1 to 255.       |

| Command Modes | Interface configuration (config-if) |
|---------------|-------------------------------------|
|               |                                     |

## Example

This example shows how to configure the path cost of an STP port:

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 1/3
Device(config-if-ethernet-1/3)# spanning-tree cost 1000
Device(config-if-ethernet-1/3)#
Device>
```

**Example**

This example shows how to enable loop guard on an STP port:

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 1/3
Device(config-if-ethernet-1/3)# spanning-tree loop-guard
Device(config-if-ethernet-1/3)#

```

**Example**

This example shows how to configure Mcheck on an STP port:

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 1/3
Device(config-if-ethernet-1/3)# spanning-tree mcheck
Device(config-if-ethernet-1/3)#

```

**Example**

This example shows how to enable point to point link on an STP port:

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 1/3
Device(config-if-ethernet-1/3)# spanning-tree point-to-point forcetrue
Device(config-if-ethernet-1/3)#

```

**Example**

This example shows how to configure the STP priority of an STP port:

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 1/3
Device(config-if-ethernet-1/3)# spanning-tree port-priority 3
Device(config-if-ethernet-1/3)#

```

**Example**

This example shows how to configure the STP port as an edge port:

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 1/3
Device(config-if-ethernet-1/3)# spanning-tree portfast
Device(config-if-ethernet-1/3)#

```

**Example**

This example shows how to enable root protection on an STP port:

## spanning-tree (interface configuration)

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 1/3
Device(config-if-ethernet-1/3)# spanning-tree root-guard
Device(config-if-ethernet-1/3)#

```

### Example

This example shows how to configure an STP port to send the maximum rate of BPDU messages:

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 1/3
Device(config-if-ethernet-1/3)# spanning-tree transit-limit 200
Device(config-if-ethernet-1/3)#

```

# time-range

To specify when an access control list (ACL) is in effect, use the **time-range** command in the global configuration mode. To remove the time range, use the **no** form of the command.

```
[no] time-range name
```

|                           |                               |   |
|---------------------------|-------------------------------|---|
| <b>Syntax Description</b> | <i>name</i>                   | Specifies a unique name for the time range. Name has to begin with an alphabetic character. |
| <b>Command Modes</b>      | Global Configuration (config) |   |
| <b>Command Default</b>    | None                          |   |

## Example

```
Device#configure terminal  
Device(config)#time-range weekends
```

# username-format

To configure a packet to carry the username when it is passed by the system to the RADIUS server, use the **username-format** command in AAA configuration module.

**username-format {with-domain | without-domain}**

|                           |   |  |
|---------------------------|---|--|
| <b>Syntax Description</b> | <b>with-domain</b><br><b>without-domain</b> | Configures the packet to carry the user domain.<br>Configures the packet to carry the user domain. |
| <b>Command Modes</b>      | AAA configuration (config-aaa)              |  |

## Example

This example shows how to configure the system to carry the user name when it passes a packet to the RADIUS server using the **username-format** command:

```
Device> enable
Device# configure terminal
Device(config)# aaa
Device(config-aaa)# radius host radius1
Device(config-aaa-radius-radius1)# username-format with-domain
  Modify the username format of RADIUS configuration successfully
```

# igmp-snooping

To enable IGMP Snooping, use the **igmp-snooping** command in the global configuration mode. To disable IGMP Snooping, use the **no** form of the command.

**igmp-snooping**

**no igmp-snooping**

| Syntax Description | igmp-snooping | Enables IGMP Snooping. |
|--------------------|---------------|------------------------|
|--------------------|---------------|------------------------|

| Command Default | IGMP Snooping is enabled by default. |
|-----------------|--------------------------------------|
|-----------------|--------------------------------------|

| Command Modes | Global configuration |
|---------------|----------------------|
|---------------|----------------------|

| Examples | The following example shows how to enable IGMP Snooping. |
|----------|--|
|----------|--|

```
Device(config)#igmp-snooping
```

# igmp-snooping drop

To configure a port to drop query or report packets, use the **igmp-snooping drop** command in the interface configuration mode. To configure the port to start receiving IGMP query or report packets, use the **no** form of the command.

**igmp-snooping drop {query | report}**

**no igmp-snooping drop**

## Syntax Description

**query** Configures the port to drop IGMP query packets.

**report** Configures the port to drop IGMP report packets.

## Command Default

Packet dropping is not enabled by default.

## Command Modes

Interface configuration

## Examples

The following example shows how to comfigure a port to drop query packets:

```
Device(config-if-ethernet-1/1)# igmp-snooping drop query
```

# igmp-snooping fast-leave

To remove the port directly from the multicast group upon receiving an IGMP Leave message, use the **igmp-snooping fast-leave** command in the interface configuration mode. To disable fast leave use the **no** form of the command.

**igmp-snooping fast-leave**

**no igmp-snooping fast-leave**

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>fast-leave</b> Removes the port directly from the multicast group upon receiving an IGMP Leave message                      |
| <b>Command Default</b>    | Fast leave is not configured by default.   |
| <b>Command Modes</b>      | Interface configuration  |
| <b>Examples</b>           | The following example shows how to configure fast leave:<br><pre>Device(config-if-ethernet-1/1)#igmp-snooping fast-leave</pre> |

**igmp-snooping group-limit action**

# igmp-snooping group-limit action

To configure the action that the port will perform when it reaches the maximum number of multicast groups it can join, use the **igmp-snooping group-limit action** command in the interface configuration mode.

**igmp-snooping group-limit action { drop | replace }**

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>drop</b> Drops the multicast group. This is the default action.<br><b>replace</b> Replaces an old multicast group with the new group. |
|---------------------------|--|

|                        |  |
|------------------------|--|
| <b>Command Default</b> | When the group limit is reached, the new group is dropped. |
|------------------------|--|

|                      |                         |
|----------------------|-------------------------|
| <b>Command Modes</b> | Interface configuration |
|----------------------|-------------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | This example shows how to configure the port to drop new multicast groups when it reaches the group limit |
|-----------------|---|

```
Device(config-if-ethernet-1/1)#igmp-snooping group-limit action drop
```

# igmp-snooping group-limit

To configure the maximum number of multicast groups that an interface or a port can learn or join, use the **igmp-snooping group-limit** command in the interface configuration mode. To undo the limit on the maximum number of multicast groups that a port can join use the **no** form of the command.

**igmp-snooping group-limit *number***

**no igmp-snooping group-limit**

---

**Syntax Description**

*number* Specifies the maximum number of multicast groups that a port can join. The range is 0-1024.

---

**Command Default**

No limit is configured by default.

**Command Modes**

Interface configuration

**Examples**

The following examples shows how to configure a group limit of 100:

```
Device(config-if-ethernet-1/4)#igmp-snooping group-limit 100
```

**igmp-snooping general-query source-ip**

## igmp-snooping general-query source-ip

To configure the source IP address for sending general query packets, use the **igmp-snooping general-query source-ip** command in the global configuration mode. To disable the source IP address for sending general query, use the **no** form of the command.

**igmp-snooping general-query source-ip *ip-address***

**no igmp-snooping general-query source-ip *ip-address***

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <i>ip-address</i> Configures the source IP address for sending general query packets. |
|---------------------------|---|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                      |
|----------------------|----------------------|
| <b>Command Modes</b> | Global configuration |
|----------------------|----------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example shows how to configure a source IP address for sending general query packets: |
|-----------------|---|

```
Device(config)# igmp-snooping general-query source-ip 192.168.1.2
```

# igmp-snooping host-aging-time

To configure the aging time of dynamic multicast members, use the **igmp-snooping host-aging-time** command in the global configuration mode. To disable aging time for dynamic multicast members use the **no** form of the command.

**igmp-snooping host-aging-timetime**

**no igmp-snooping host-aging-time**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <i>time</i> Specifies the aging time for dynamic multicast members. The range is from 10-1000000 seconds. The default value is 300 seconds. |
| <b>Command Default</b>    | The aging time is set to 300 seconds.   |
| <b>Command Modes</b>      | Global configuration  |
| <b>Examples</b>           | The following example shows how to configure an aging time of 500 seconds:<br><pre>Device(config)# igmp-snooping host-aging-time 500</pre>  |

**igmp-snooping max-response-time**

## igmp-snooping max-response-time

To configure the maximum waiting time for deleting group ports after receiving a leave packet, use the **igmp-snooping max-response-time** command in the global configuration mode. To disable a maximum waiting time use the **no** form of the command.

**igmp-snooping max-response-time *time***

**no igmp-snooping max-response-time *time***

---

### Syntax Description

***time*** Configures the maximum waiting time for deleting group ports after receiving a leave packet. The range is from 1-100 seconds. The default value is 10 seconds.

---

### Command Default

The default maximum waiting time is 10 seconds.

### Command Modes

Global configuration

### Examples

The following example shows how to configure a maximum response time of 20 seconds:

```
Device(config)# igmp-snooping max-response-time 20
```

# igmp-snooping multicast vlan

To configure multicast VLAN for IGMP packets, use the **igmp-snooping multicast vlan** command in the interface configuration mode. To disable multicast VLAN for IGMP packets, use the **no** form of the command.

**igmp-snooping multicast vlan *vlan-id***

**no igmp-snooping multicast vlan**

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>multicast vlan</b> Configures multicast VLAN for the IGMP packets on the port.  |
| <b>Command Default</b>    | None   |
| <b>Command Modes</b>      | Interface configuration  |
| <b>Examples</b>           | The following example shows how to enable multicast VLAN for IGMP packets on VLANs 1-50:<br><pre>Device(config-if-ethernet-1/1)# igmp-snooping multicast vlan 50</pre> |

**igmp-snooping {permit|deny}**

## igmp-snooping {permit|deny}

To configure the default learning rule for multicast groups that are not in the blocked list or the allowed list, use the **igmp-snooping {permit|deny}** command in the global configuration mode. By default, the learning rule for all multicast groups that are not in the blocked list or the allowed list is to learn all multicast groups.

**igmp-snooping { permit | deny } { group all | vlan *lan-id* }**

---

### Syntax Description

**permit** Configures the list of groups that are permitted to join by IGMP snooping.

**deny** Configures the list of groups that are denied to join by IGMP snooping.

---

### Command Default

Default is to learn all multicast groups that are not in the blocked list or the allowed list

---

### Command Modes

Global configuration

---

### Examples

This example shows how to configure the rule to learn all multicast groups:

```
Device(config)#igmp-snooping permit group all
```

# igmp-snooping profile refer

To configure a profile or a list of profiles as a reference for a port, use the **igmp-snooping profile refer** command in the interface configuration mode. You can disable the profile reference of a port using the **no** form of the command.

**igmp-snooping profile refer***profile-list*

**no igmp-snooping profile refer***profile-list*

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <i>profile-list</i> Configures a list of reference profiles for the port. |
|---------------------------|---|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                         |
|----------------------|-------------------------|
| <b>Command Modes</b> | Interface configuration |
|----------------------|-------------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example shows how to create reference profile for the port: |
|-----------------|---|

```
Device(config-if)# igmp-snooping profile refer 1-5
```

# igmp-snooping profile

To create an IGMP Snooping profile, use the **igmp-snooping profile** command in the global configuration mode. To disable IGMP snooping profile use the **no** form of the command.

**igmp-snooping profile** *profile-id*

**no igmp-snooping profile**

---

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <i>profile-id</i> Functions as an identifier for an IGMP Snooping profile. The range is 1-128. |
|---------------------------|--|

---

|                        |  |
|------------------------|--|
| <b>Command Default</b> | IGMP Snooping profile is not enabled by default. |
|------------------------|--|

---

|                      |                      |
|----------------------|----------------------|
| <b>Command Modes</b> | Global configuration |
|----------------------|----------------------|

---

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example shows how to create an IGMP Snooping profile: |
|-----------------|---|

```
Device(config)# igmp-snooping profile 1
```

# igmp-snooping {permit|deny} group-range

To configure a port to learn (or not learn) a range of MAC addresses and VLAN ids, use the **igmp-snooping {permit|deny} group-range** command in the interface configuration mode.

**igmp-snooping { permit | deny } group-range *MAC-address multi-count multi-count-number* *vlan vlan-list***

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>multi-count <i>multi-count-number</i></b> Configures the number of MAC addresses in the group range. |
|---------------------------|---|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                         |
|----------------------|-------------------------|
| <b>Command Modes</b> | Interface configuration |
|----------------------|-------------------------|

|                 |  |
|-----------------|--|
| <b>Examples</b> | The following example shows how to permit a group range of MAC addresses and VLAN ids: |
|-----------------|--|

```
Device(config-if-ethernet-1/1)# igmp-snooping permit group-range 01:00:5e:09:08:07 multi-count 12 vlan 10
```

# igmp-snooping query-interval

To configure the interval for sending general query packets, use the **igmp-snooping query-interval** command in the global configuration mode.

**igmp-snooping query-interval *interval***

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <i>interval</i> Configures the interval for sending general query packets. The range is from 1 to 30000 seconds. |
|---------------------------|--|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                      |
|----------------------|----------------------|
| <b>Command Modes</b> | Global configuration |
|----------------------|----------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example shows how to configure the IGMP Snooping query interval to 500 seconds: |
|-----------------|---|

```
Device(config)# igmp-snooping query-interval 500
```

# igmp-snooping querier version

To configure the version of the IGMP Snooping querier, use the **igmp-snooping querier version** command in the global configuration mode. The IGMP snooping querier version is set to 2 by default.

**igmp-snooping querier version** *version-id*

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <i>version-id</i> Configures the version of the IGMP Snooping querier. The range is 2-3. The default version is 2. |
|---------------------------|--|

|                        |   |
|------------------------|---|
| <b>Command Default</b> | the querier is set to version 2 by default. |
|------------------------|---|

|                      |                      |
|----------------------|----------------------|
| <b>Command Modes</b> | Global configuration |
|----------------------|----------------------|

|                 |  |
|-----------------|--|
| <b>Examples</b> | The following example shows how to configure the IGMP Snooping querier version to version 3: |
|-----------------|--|

```
Device(config)# igmp-snooping querier version 3
```

**igmp-snooping querier-vlan**

# igmp-snooping querier-vlan

To configure VLANs for general query packets, use the **igmp-snooping querier-vlan** command in the global configuration mode. To disable VLANs for query packets use the **no** form of the command.

**igmp-snooping querier-vlan***vlan-list*

**no igmp-snooping querier-vlan***vlan-list*

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>querier-vlan</b> Configures a list of VLANs for general query packets. |
|---------------------------|---|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                      |
|----------------------|----------------------|
| <b>Command Modes</b> | Global configuration |
|----------------------|----------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example shows how to configure VLANs for the IGMP-Snooping querier: |
|-----------------|---|

```
Device(config)# igmp-snooping querier-vlan 1-50
```

# igmp-snooping query-max-respond

To configure the maximum response time for general query packets, use the **igmp-snooping query-max-respond** command in the global configuration mode. To disable a maximum response time, use the **no** form of the command.

**igmp-snooping query-max-respond *time***

**no igmp-snooping query-max-respond *time***

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <i>time</i> Configures the maximum response time for general query packets. The range is from 1 to 25 seconds. |
|---------------------------|--|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                      |
|----------------------|----------------------|
| <b>Command Modes</b> | Global configuration |
|----------------------|----------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example shows how to configure the maximum response time for general query packets to 10 seconds: |
|-----------------|---|

```
Device(config)# igmp-snooping query-max-respond 10
```

**igmp-snooping record-host**

# igmp-snooping record-host

To enable recording the MAC address of the source of an IGMP report packet, use the **igmp-snooping record-host** command in the interface configuration mode. To disable the recording of the host MAC address, use the **no** form of the command.

**igmp-snooping record-host****no igmp-snooping record-host**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>record-host</b> Enables recording the MAC address of the source of an IGMP report packet |
|---------------------------|---|

|                        |                                     |
|------------------------|-------------------------------------|
| <b>Command Default</b> | recording is not enabled by default |
|------------------------|-------------------------------------|

|                      |                         |
|----------------------|-------------------------|
| <b>Command Modes</b> | Interface configuration |
|----------------------|-------------------------|

|                 |  |
|-----------------|--|
| <b>Examples</b> | The following example shows how to configure a port to record the host MAC address |
|-----------------|--|

```
Device(config-if-ethernet-1/1)# igmp-snooping record-host
```

# igmp-snooping router-port-age

To configure the ageing time for the dynamic route port, use the **igmp-snooping router-port-age** command in the global configuration mode. To disable ageing time for the dynamic route port, use the **no** form of the command.

**igmp-snooping router-port-age { on | off | age-time }**

**no igmp-snooping router-port-age { on | off | age-time }**

| Syntax Description | <b>on</b> Starts router port age<br><b>off</b> Stops router port age.<br><b>age-time</b> Sets router port age time in seconds. The range is 10-1000000 seconds. The default value is 300 seconds. |
|--------------------|---|
| Command Default    | The router port age is on by default.   |
| Command Modes      | Global configuration  |
| Examples           | The following example shows how to start the rotuter port age:<br>Device(config)# igmp-snooping router-port-age on  |

**igmp-snooping route-port forward**

# igmp-snooping route-port forward

To configure a dynamic route port to forward multicast traffic packets, use the **igmp-snooping route-port forward** command in the global configuration mode. To disable the route port from forwarding multicast traffic packets, use the **no** form of the command.

**igmp-snooping route-port forward**

**no igmp-snooping route-port forward**

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>forward</b> Configures the port to forward multicast traffic packets. |
|---------------------------|--|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                      |
|----------------------|----------------------|
| <b>Command Modes</b> | Global configuration |
|----------------------|----------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example shows how to configure a dynamic route port to forward multicast traffic packets: |
|-----------------|---|

```
Device(config)# igmp-snooping route-port forward
```

# igmp-snooping report-supression

To enable IGMP Snooping supression of multicast reports, use the **igmp-snooping report-supression** command in the global configuration mode. To disable the suppression of multicast reports, use the **no** form of the command.

**igmp-snooping report-supression**

**no igmp-snooping report-supression**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>report-supression</b> Enables IGMP Snooping supression of multicast reports. |
|---------------------------|---|

|                        |  |
|------------------------|--|
| <b>Command Default</b> | Report supression is not enabled by default. |
|------------------------|--|

|                      |                      |
|----------------------|----------------------|
| <b>Command Modes</b> | Global configuration |
|----------------------|----------------------|

|                 |  |
|-----------------|--|
| <b>Examples</b> | The following example shows how to enable IGMP Snooping report supression: |
|-----------------|--|

```
Device(config)# igmp-snooping report-supression
```

**igmp-snooping route-port vlan**

# igmp-snooping route-port vlan

To configure a static route port, use the **igmp-snooping route-port vlan** command in the global configuration mode. You can disable the static route port by using the **no** form of the command.

**igmp-snooping route-port vlan *vlan-id* interface { all | channel-group *channel-group-id* | ethernet *interface-number* }**

**no igmp-snooping route-port vlan *vlan-id* interface { all | channel-group *channel-group-id* | ethernet *interface-number* }**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <p><i>channel-group-id</i> Specifies the number of the channel group. The range is from 0-5.</p> <p><i>interface-number</i> Specifies the ethernet interface number.</p>            |
| <b>Command Default</b>    | None.   |
| <b>Command Modes</b>      | Global configuration  |
| <b>Examples</b>           | <p>The following examples shows how to configure all the ports of an interface as static route ports:</p> <pre>Device(config)# igmp-snooping route-port vlan 50 interface all</pre> |

# ip range

To configure the range of IP addresses and VLAN IDs for an IGMP profile, use the **ip range** command in profile configuration mode.

**ip range start-ip-address end-ip-address **vlan** vlan-id**

|                           |  |                         |   |                       |   |                |  |
|---------------------------|--|-------------------------|---|-----------------------|---|----------------|--|
| <b>Syntax Description</b> | <table border="0"> <tr> <td><i>start-ip-address</i></td><td>Configures the start IP Address for the IGMP Snooping profile. The IP addresses range is from 224.0.0.1 to 239.255.255.254.</td></tr> <tr> <td><i>end-ip-address</i></td><td>Configures the end IP Address for the IGMP Snooping profile. The IP addresses range is from 224.0.0.1 to 239.255.255.254.</td></tr> <tr> <td><i>vlan-id</i></td><td>Configures the range of VLAN IDs for the IGMP Snooping profile. The VLAN id range is from 1 to 4094.</td></tr> </table> | <i>start-ip-address</i> | Configures the start IP Address for the IGMP Snooping profile. The IP addresses range is from 224.0.0.1 to 239.255.255.254. | <i>end-ip-address</i> | Configures the end IP Address for the IGMP Snooping profile. The IP addresses range is from 224.0.0.1 to 239.255.255.254. | <i>vlan-id</i> | Configures the range of VLAN IDs for the IGMP Snooping profile. The VLAN id range is from 1 to 4094. |
| <i>start-ip-address</i>   | Configures the start IP Address for the IGMP Snooping profile. The IP addresses range is from 224.0.0.1 to 239.255.255.254.  |                         |   |                       |   |                |  |
| <i>end-ip-address</i>     | Configures the end IP Address for the IGMP Snooping profile. The IP addresses range is from 224.0.0.1 to 239.255.255.254.  |                         |   |                       |   |                |  |
| <i>vlan-id</i>            | Configures the range of VLAN IDs for the IGMP Snooping profile. The VLAN id range is from 1 to 4094.   |                         |   |                       |   |                |  |
| <b>Command Default</b>    | <table border="0"> <tr> <td>None</td><td></td></tr> <tr> <td></td><td>Profile configuration mode</td></tr> </table>  | None                    |   |                       | Profile configuration mode  |                |  |
| None                      |  |                         |   |                       |   |                |  |
|                           | Profile configuration mode   |                         |   |                       |   |                |  |

## Examples

The following example shows how to configure the range of IP addresses and VLAN ids for an IGMP Snooping profile.

```
Device(config-igmp-profile-1)# ip range 224.0.0.1 239.255.255.254 vlan 50
```

## mac range

To configure the range of MAC addresses and VLAN IDs for an IGMP profile, use the **mac range** command in profile configuration mode.

**mac range *start-mac-address end-mac-address vlan vlan-id***

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <p><i>start-mac-address</i> Configures the start MAC Address for the IGMP Snooping profile. The MAC addresses range is 01:00:5e:H:H:H. .</p> <p><i>end-mac-address</i> Configures the end MAC Address for the IGMP Snooping profile. The MAC addresses range is 01:00:5e:H:H:H.</p> <p><i>vlan-id</i> Configures the range of VLAN IDs for the IGMP Snooping profile. The VLAN id range is from 1 to 4094.</p> |
| <b>Command Default</b>    | None   |
| <b>Command Modes</b>      | Profile configuration  |

**Examples** The following example shows how to configure the range of MAC addresses and VLAN ids for an IGMP Snooping profile.

```
Device(config-igmp-profile-1)# mac range 01:00:5e:09:08:07 01:00:5e:09:09:08 vlan 50
```

# mld-snooping

To enable MLD Snooping, use the **mld-snooping** command in the global configuration mode. To disable MLD Snooping, use the **no** form of the command.

**mld-snooping**

**no mld-snooping**

**Command Default** MLD Snooping is disabled by default.

**Command Modes** Global configuration

**Examples** The following example shows how to enable MLD Snooping.

```
Device(config)# mld-snooping
```

## mld-snooping fast-leave

To remove the port directly from the multicast group upon receiving a Leave message, use the **mld-snooping fast-leave** command in the interface configuration mode. To disable fast leave, use the **no** form of the command.

**Command Default** Fast leave is not configured by default.

**Command Modes** Interface configuration

**Examples** The following example shows how to configure fast leave:

```
Device(config-if-ethernet-1/1)# mld-snooping fast-leave
```

# mld-snooping group-limit

To configure the maximum number of IPv6 multicast groups that an interface or a port can learn or join, use the **mld-snooping group-limit** command in the interface configuration mode. To undo the limit on the maximum number of IPv6 multicast groups that a port can join use the **no** form of the command.

**mld-snooping group-limit *number***

**no mld-snooping group-limit**

---

**Syntax Description**

*number* Specifies the maximum number of IPv6 multicast groups that a port can join. The range is 0-1024.

---

**Command Default**

No limit is configured by default.

**Command Modes**

Interface configuration

**Examples**

The following example shows how to configure a group limit of 100:

```
Device(config-if-ethernet-1/4)# mld-snooping group-limit 100
```

**mld-snooping host-aging-time**

# mld-snooping host-aging-time

To configure the aging time of dynamic multicast ports, use the **mld-snooping host-aging-time** command in the global configuration mode. To disable aging time for dynamic multicast ports use the **no** form of the command.

**mld-snooping host-aging-time *time***

**no mld-snooping host-aging-time**

---

## Syntax Description

**time** Specifies the aging time for dynamic multicast ports. The range is from 10-1000000 seconds. The default value is 300 seconds.

---

## Command Default

The aging time is set to 300 seconds.

## Command Modes

Global configuration

## Examples

The following example shows how to configure an aging time of 500 seconds for a host:

```
Device(config)# mld-snooping host-aging-time 500
```

# mld-snooping max-response-time

To configure the maximum response time of the leave packets, use the **mld-snooping max-response-time** command in the global configuration mode. To disable the maximum response time, use the **no** form of the command.

**mld-snooping max-response-time *time***

**no mld-snooping max-response-time *time***

---

**Syntax Description**

*time* Configures the maximum waiting time to send a response after receiving a leave packet. The range is from 1-100 seconds. The default value is 10 seconds.

---

**Command Default**

The default maximum waiting time is 10 seconds.

**Command Modes**

Global configuration

**Examples**

The following example shows how to configure a maximum response time of 20 seconds:

```
Device(config)# mld-snooping max-response-time 20
```

# mld-snooping multicast vlan

To configure multicast VLAN with MLD snooping, use the **mld-snooping multicast vlan** command in the global configuration mode.

**mld-snooping multicast vlan *vlan\_id***

|                           |   |  |
|---------------------------|---|--|
| <b>Syntax Description</b> | <i>vlan_id</i>  | The VLAN ID.<br>The range is from 1 to 4094. |
| <b>Command Default</b>    | None  |  |
| <b>Command Modes</b>      | Interface configuration (config-if)                                   |  |
| <b>Examples</b>           | This example shows how to configure multicast VLAN with MLD snooping: |  |

```
Device> enable
Device# configure terminal
Device(config)# interface gpon 0/1
Device(config-if-gpon-0/1)# mld-snooping multicast vlan 1
```

# mld-snooping {permit|deny}{group|vlan}

To specify a learning rule on the device for the multicast groups that are not part of a blocked list or an allowed list, use the **mld-snooping { permit | deny } { group | vlan }** command in the global configuration mode.

```
mld-snooping { permit | deny } { group all | vlan vlan-list }
```

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>group all</b> Specifies that the learning policy applies to all multicast groups.  |
|                           | <b>vlan <i>vlan-list</i></b> Specifies the VLAN to which the learning policy applies. |

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                      |
|----------------------|----------------------|
| <b>Command Modes</b> | Global configuration |
|----------------------|----------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example shows how to permit the learning rule for all multicast groups. |
|-----------------|---|

```
Device(config)# mld-snooping permit group all
```

**mld-snooping permit deny group MAC vlan**

## mld-snooping permit deny group MAC vlan

To configure a list of multicast groups that are permitted or denied by MLD snooping in a particular VLAN, use the **mld-snooping { permit | deny} group MAC vlan *vlan-id*** in the interface configuration mode.

**mld-snooping { permit | deny } group *MAC-address* *vlan* *vlan-id***

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <i>MAC-address</i> Specifies the list of multicast groups that start at the <i>MAC-address</i> |
|---------------------------|--|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                         |
|----------------------|-------------------------|
| <b>Command Modes</b> | Interface configuration |
|----------------------|-------------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example shows how to permit a group of MAC addresses in VLAN 5: |
|-----------------|---|

```
Device(config-if-ethernet-1/1)# mld-snooping permit group 33:33:5e:09:08:07 vlan 5
```

# mld-snooping {permit|deny} group-range

To configure a port to learn (or not learn) a range of MAC addresses and VLAN ids, use the **mld-snooping {permit|deny} group-range** command in the interface configuration mode.

```
mld-snooping { permit | deny } group-range MAC-address multi-count multi-count-number vlan vlan-list
```

**Syntax Description**

**multi-count** *multi-count-number* Configures the number of MAC addresses in the group range.

**Command Default**

None

**Command Modes**

Interface configuration

**Examples**

The following example shows how to permit a group range of MAC addresses and VLAN ids:

```
Device(config-if-ethernet-1/1)# mld-snooping permit group-range 33:33:5e:09:08:07 multi-count 12 vlan 10
```

# mld-snooping querier

To enable MLD Snooping querier to forward the source address, maximum response time, and query interval for sending general query messages, use the **mld-snooping querier** command in the global configuration mode. To disable MLD Snooping querier, use the **no** form of the command.

## mld-snooping querier

**Command Default** MLD Snooping querier is disabled by default.

**Command Modes** Global configuration

**Examples** The following example shows how to enable MLD Snooping querier :

```
Device(config)# mld-snooping querier
```

# mld-snooping querier-vlan

To configure VLANs for general query packets, use the **mld-snooping querier-vlan** command in the global configuration mode. To disable VLANs for query packets use the **no** form of the command.

**mld-snooping querier-vlan *vlan-id***

**no mld-snooping querier-vlan *vlan-id***

---

**Syntax Description**

*vlan-id* Specifies the VLAN that carries the general query packets.

The range is 1 to 4094.

---

**Command Default**

None

**Command Modes**

Global configuration

**Examples**

The following example shows how to configure a VLAN for the MLD Snooping querier:

```
Device(config)# mld-snooping querier-vlan 50
```

**mld-snooping query-interval**

# mld-snooping query-interval

To configure the interval for sending mld snooping general query packets, use the **mld-snooping query-interval** command in the global configuration mode.

**mld-snooping query-interval *interval***

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <i>interval</i> Configures the interval for sending mld-snooping general query packets. The range is from 1 to 30000 seconds. |
|---------------------------|---|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                      |
|----------------------|----------------------|
| <b>Command Modes</b> | Global configuration |
|----------------------|----------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example shows how to configure the MLD Snooping query interval to 3000 seconds: |
|-----------------|---|

```
Device(config)# mld-snooping query-interval 3000
```

# mld-snooping query-max-respond

To configure the maximum response time for general query packets, use the **mld-snooping query-max-respond** command in the global configuration mode. To disable a maximum response time, use the **no** form of the command

**mld-snooping query-max-respond *time***

**no mld-snooping query-max-respond *time***

---

**Syntax Description**

*time* Configures the maximum response time for general query packets. The range is from 1 to 25 seconds.

---

**Command Default**

None

**Command Modes**

Global configuration

**Examples**

The following example shows how to configure the maximum response time for general query packets to 10 seconds:

```
Device(config)# mld-snooping query-max-respond 10
```

# mld-snooping route-port forward

To configure a dynamic route port to forward IPv6 multicast traffic packets, use the **mld-snooping route-port forward** command in the global configuration mode. To disable the route port from forwarding IPv6 multicast traffic packets, use the **no** form of the command.

**mld-snooping route-port forward**

**no igmp-snooping route-port forward**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>forward</b> Configures the port to forward IPv6 multicast traffic packets. |
|---------------------------|---|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                      |
|----------------------|----------------------|
| <b>Command Modes</b> | Global configuration |
|----------------------|----------------------|

|                 |  |
|-----------------|--|
| <b>Examples</b> | The following example shows how to configure a dynamic route port to forward IPv6 multicast traffic packets: |
|-----------------|--|

```
Device(config)# mld-snooping route-port forward
```

# mld-snooping route-port vlan

To configure a multicast router VLAN and specify the interface to the multicast router, use the **mld-snooping route-port vlan** command in the global configuration mode. You can disable the multicast router VLAN by using the **no** form of the command.

```
mld-snooping route-port vlan vlan-id interface { all | ethernet interface-number
```

```
no mld-snooping route-port vlan vlan-id interface { all | ethernet interface-number
```

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>all</b> Specifies that all ports are multicast router interfaces.<br><b>ethernet <i>interface-number</i></b> Specifies the ethernet interface number. |
|---------------------------|--|

|                        |       |
|------------------------|-------|
| <b>Command Default</b> | None. |
|------------------------|-------|

|                      |                      |
|----------------------|----------------------|
| <b>Command Modes</b> | Global configuration |
|----------------------|----------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following examples shows how to configure all the ports of an interface as multicast route ports: |
|-----------------|---|

```
Device(config)# mld-snooping route-port vlan 50 interface all
```

# mld-snooping router-port-age

To configure the ageing time for the dynamic route port, use the **mld-snooping router-port-age** command in the global configuration mode. To disable ageing time for the dynamic route port, use the **no** form of the command.

**mld-snooping router-port-age { on | off | age-time }**

**no mld-snooping router-port-age { on | off | age-time }**

---

## Syntax Description

**on** Starts router port age

**off** Stops router port age.

**age-time** Sets router port age time in seconds. The range is 10-1000000 seconds. The default value is 300 seconds.

---

---

## Command Default

The router port age is on by default.

---

## Command Modes

Global configuration

---

## Examples

The following example shows how to start the router port age:

```
Device(config)# mld-snooping router-port-age on
```

# mld-snooping record-host

To enable the port to record the host information, use the **mld-snooping record-host** command in the global configuration mode.

## **mld-snooping record-host**

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                                     |
|----------------------|-------------------------------------|
| <b>Command Modes</b> | Interface configuration (config-if) |
|----------------------|-------------------------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | This example shows how to enable the port to record the host information: |
|-----------------|---|

```
Device> enable
Device# configure terminal
Device(config)# interface gpon 0/1
Device(config-if-gpon-0/1)# mld-snooping record-host
```

# multicast

To create a static multicast group, use the **multicast** command in the global configuration mode.

```
multicast { mac-address mac-address | ip-address ip-address } vlan vlan-id
```

## Syntax Description

|                   |   |
|-------------------|---|
| <i>ip-address</i> | Configures the static multicast IP address. It can only be in the format 224.x.x.x. |
|-------------------|---|

|                    |   |
|--------------------|---|
| <i>mac-address</i> | Configures the static multicast MAC address. It can only be in the format 01:00:5e:H:H:H. |
|--------------------|---|

|                |  |
|----------------|--|
| <i>vlan-id</i> | Configures the VLANs for the static multicast group. |
|----------------|--|

## Command Default

Multicast group is not configured by default.

## Command Modes

Global configuration

The following example shows how to configure a static multicast group:

```
Device(config)# multicast ip-address 224.0.0.3 vlan 50
Adding multicast group successfully !
```

# multicast ds-tag add

To configure the ONT downlink multicast VLAN tag adding rule, use the **multicast ds-tag add** command in line profile configuration mode.

To disable the ONT uplink multicast VLAN tag adding rule, use the **no multicast ds-tag add** command.

**multicast ds-tag add *vlan\_id* {*priority* | *port port\_id*}**

**no multicast ds-tag port *port\_id***

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <p><i>vlan_id</i></p> <p>The VLAN ID<br/>The range is from 1 to 4094.</p> |
| <i>priority</i>           | <p>The 802.1 priority value.<br/>The range is from 0 to 7.</p>            |
| <i>port_id</i>            | <p>The ONT Ethernet port ID.<br/>The range is from 1 to 24.</p>           |

**Command Modes** Line profile configuration (deploy-profile-line)

**Examples** This example shows how to configure the ONT downlink multicast VLAN tag adding rule.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# multicast ds-tag add 3
```

**multicast ds-tag remove**

## multicast ds-tag remove

To configure the ONT downlink multicast VLAN tag removing rule, use the **multicast ds-tag remove port** command in line profile configuration mode. To delete the ONT downlink multicast VLAN tag, use the **no multicast ds-tag port** command

**multicast ds-tag remove [port *port\_id*]**

**no multicast ds-tag [port *port\_id*]**

|                           |                |  |
|---------------------------|----------------|--|
| <b>Syntax Description</b> | <i>port_id</i> | The ONT Ethernet port ID. The range is from 1 to 24. |
|---------------------------|----------------|--|

|                      |  |
|----------------------|--|
| <b>Command Modes</b> | Line profile configuration (deploy-profile-line) |
|----------------------|--|

### Examples

This example shows how to configure the ONT downlink multicast VLAN tag removing rule.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# multicast ds-tag remove
```

# multicast ds-tag translate

To configure the ONT downlink multicast VLAN tag translating rule, use the **multicast ds-tag translate** command in line profile configuration mode.

**multicast ds-tag translate *vlan\_id* [*priority* | *port port\_id*]**

|                           |                 |   |
|---------------------------|-----------------|---|
| <b>Syntax Description</b> | <i>vlan_id</i>  | The VLAN ID<br>The range is from 1 to 4094.             |
|                           | <i>priority</i> | The 802.1 priority value.<br>The range is from 0 to 7.  |
|                           | <i>port_id</i>  | The ONT Ethernet port ID.<br>The range is from 1 to 24. |

**Command Modes** Line profile configuration (deploy-profile-line)

**Usage Guidelines** You must configure a device type.

**Examples** This example shows how to configure the ONT downlink multicast VLAN tag translating rule.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# multicast ds-tag translate 3
```

**multicast fast-leave disable**

## multicast fast-leave disable

To disable fast-leave, use the **multicast fast-leave disable** command in global configuration mode.

**multicast fast-leave disable [port *port\_id*]**

**no multicast fast-leave disable [port *port\_id*]**

### Syntax Description

*port\_id*

The ONT Ethernet port ID. The range is from 1 to 24.

### Command Modes

Line profile configuration (deploy-profile-line)

### Examples

This example shows how to disable fast-leave on a port.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# multicast fast-leave disable
```

# multicast group-limit

To configure the limit of multicast groups, use the **multicast group-limit *limit\_number*** command in line profile configuration mode. To disable the limit of multicast groups, use the **no multicast group-limit *limit\_number*** command.

**multicast group-limit *limit\_number* [port *port\_id*]**

**no multicast group-limit *limit\_number* [port *port\_id*]**

|                           |                     |   |
|---------------------------|---------------------|---|
| <b>Syntax Description</b> | <i>limit_number</i> | The multicast group limit. The range is from 1 to 16. |
|                           | <i>port_id</i>      | The ONT Ethernet port ID. The range is from 1 to 4.   |

**Command Modes** Line profile configuration (deploy-profile-line)

## Examples

This example shows how to configure the limit of multicast groups.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# multicast group-limit 4
```

# multicast interface

To add a port to a static multicast group, use the **multicast interface** command in the global configuration mode.

```
multicast { mac-address mac-address | ip-address ip-address } vlan vlan-id interface { all | interface-list }
```

## Syntax Description

*all* Adds all the ports of the interface to the static multicast group.

*interface-list* Adds the specified ports of the interface to the static multicast group.

## Command Default

None.

## Command Modes

Global configuration

The following example shows how to add all the ports of an interface to a static multicast group:

```
Device(config)# multicast ip-address 224.0.0.11
vlan 1 interface all
```

# multicast mode igmp-snooping

To enable Internet Group Management Protocol (IGMP) snooping, use the **multicast mode igmp-snooping** command in line profile configuration mode.

**multicast mode igmp-snooping [port *port\_id*]**

|                           |   |  |
|---------------------------|---|--|
| <b>Syntax Description</b> | <i>port_id</i>  | The ONT Ethernet port ID. The range is from 1 to 16. |
| <b>Command Modes</b>      | Line profile configuration (deploy-profile-line)          |  |
| <b>Examples</b>           | This example shows how to enable IGMP snooping on a port. |  |

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# multicast mode igmp-snooping port 10
```

**multicast proxy-interval**

# multicast proxy-interval

To configure the interval at which the device sends report packets to the multicast source through the proxy port, use the **multicast proxy-interval** command in the global configuration mode.

**multicast proxy-interval *seconds***

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>proxy-interval</b> Configures the interval at which the device sends report packets to the multicast source through the proxy port.<br><b>seconds</b> Configures the proxy-interval in seconds. The range is from 1-300. The default is 10 seconds. |
| <b>Command Default</b>    | The default interval is 10 seconds.  |
| <b>Command Modes</b>      | Global configuration   |

## Example

The following example shows how to configure the proxy-interval to 100 seconds

```
Device(config)# multicast proxy-interval 100
```

# multicast proxy-port

To configure a proxy-port for the static multicast group, use the **multicast proxy-port** command in the global configuration mode.

```
multicast { mac-address mac-address | ip-address ip-address } vlan vlan-id proxy-port ethernet port-id
```

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>proxy-port</b> Configures a proxy port to send the multicast report to the multicast source.<br><br><b><i>port-id</i></b> Configures the port that will act as the proxy port. |
| <b>Command Default</b>    | None  |
| <b>Command Modes</b>      | Global configuration  |

The following example shows how to configure a proxy port for a static multicast group:

```
Device(config)# multicast ip-address 225.0.0.11 vlan 1 proxy-port ethernet 1/1
```

**multicast us-tag add**

## multicast us-tag add

To configure the ONT uplink multicast VLAN tag adding rule, use the **multicast us-tag add** command in line profile configuration mode. To disable the ONT uplink multicast VLAN tag adding rule, use the **no multicast us-tag add** command.

**multicast us-tag add** *vlan\_id {priority | port port\_id}*

no **multicast us-tag port** *port\_id*

|                           |                 |   |
|---------------------------|-----------------|---|
| <b>Syntax Description</b> | <i>vlan_id</i>  | The VLAN ID<br>The range is from 1 to 4094.             |
|                           | <i>priority</i> | The 802.1 priority value.<br>The range is from 0 to 7.  |
|                           | <i>port_id</i>  | The ONT Ethernet port ID.<br>The range is from 1 to 24. |

|                      |  |
|----------------------|--|
| <b>Command Modes</b> | Line profile configuration (deploy-profile-line) |
|----------------------|--|

|                 |   |
|-----------------|---|
| <b>Examples</b> | This example shows how to configure the ONT uplink multicast VLAN tag adding rule |
|-----------------|---|

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# multicast us-tag add 3
```

# multicast us-tag translate

To configure the ONT downlink multicast VLAN tag translating rule, use the **multicast us-tag translate** command in line profile configuration mode. To disable the ONT downlink multicast VLAN tag translating rule, use the **no multicast us-tag translate** command

**multicast us-tag translate *vlan\_id* {*priority* | **port** *port\_id*}**

**no multicast us-tag port *port\_id***

|                           |                 |   |
|---------------------------|-----------------|---|
| <b>Syntax Description</b> | <i>vlan_id</i>  | The VLAN ID<br>The range is from 1 to 4094.             |
|                           | <i>priority</i> | The 802.1 priority value.<br>The range is from 0 to 7.  |
|                           | <i>port_id</i>  | The ONT Ethernet port ID.<br>The range is from 1 to 24. |

**Command Modes** Line profile configuration (deploy-profile-line)

**Examples** This example shows how to configure the ONT uplink multicast VLAN tag translating rule.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# multicast us-tag translate 3
```

# profile limit

To configure the IGMP snooping profile type as a permit or deny profile, use the **profile limit** command in the profile configuration mode.

**profile limit { permit | deny }**

---

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>permit</b> Configures a list of groups that are permitted by the IGMP Snooping profile. |
|---------------------------|--|

---

|             |   |
|-------------|---|
| <b>deny</b> | Configures a list of groups that are denied by the IGMP Snooping profile. |
|-------------|---|

---

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

---

|                      |                       |
|----------------------|-----------------------|
| <b>Command Modes</b> | Profile configuration |
|----------------------|-----------------------|

---

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example shows how to configure a permit type profile: |
|-----------------|---|

```
Device(config-igmp-profile-1)# profile limit permit
```

# show igmp-snooping

To displays IGMP Snooping configurations, use the **show igmp-snooping** command in the EXEC mode.

## show igmp-snooping

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>igmp-snooping</b> Displays IGMP Snooping configurations. |
| <b>Command Default</b>    | None  |
| <b>Command Modes</b>      | User EXEC<br>Privileged EXEC                                |

## Examples

The following example shows the output from **show igmp-snooping** command on an interface where IGMP Snooping is enabled:

```
Device# show igmp-snooping
Enable IGMP-Snooping
Disable IGMP-Snooping report-suppression
The max response time is 10 second(s)
The host aging time is 300 second(s).
Disable IGMP-Snooping route-port forward
The Router port timeout is 300 second(s), Currently aging is running
Denied VLAN:
Blocked list:
NULL
Allowed list:
NULL
Default group policy is permit

e2/2 1024 drop disabled disabled disabled null
```

**show igmp-snooping profile**

# show igmp-snooping profile

To display the details of an IGMP Snooping profile, use the **show igmp-snooping profile** command in the EXEC mode.

**showigmp-snooping profile {profile-id | interface port-id | vlan vlan-id}**

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <p><i>profile-id</i> Displays the details of the particular IGMP Snooping profile</p> <p><i>port-id</i> Displays the IGMP Snooping profile details for the port.</p> <p><i>vlan-id</i> Displays the IGMP Snooping profile details for the VLANs.</p> |
|---------------------------|--|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                              |
|----------------------|------------------------------|
| <b>Command Modes</b> | User EXEC<br>Privileged EXEC |
|----------------------|------------------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example displays the output of the <b>show igmp-snooping profile</b> command: |
|-----------------|---|

```
Device# show igmp-snooping profile 1

IGMP-Snooping profile 1
Profile description :
Profile limit      : permit
Profile referred   : e1/1.
start-address      : 224.0.0.1          end-address    : 239.255.255.254      vlan       : any
Total ip range: 1, mac range: 0

Total profiles: 1, IP&MAC ranges: 1
```

# show igmp-snooping record-host

To display the MAC address of the record host, use the **show igmp-snooping record-host** command in the EXEC mode.

**show igmp-snooping record-host [interface-id]**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>record-host</b> Displays the MAC address of the record host.<br><br><b>interface-id</b> Displays the MAC address of the record host for the interface. |
| <b>Command Default</b>    | None  |
| <b>Command Modes</b>      | User EXEC<br>Privileged EXEC  |

**Examples** The following example shows the output of the **show igmp-snooping record-host** command:

```
Device# show igmp-snooping record-host
show host record information
Total Record: 0
```

show igmp-snooping router-dynamic

## show igmp-snooping router-dynamic

To display the dynamic route ports, use the **show igmp-snooping router-dynamic** command in the EXEC mode.

**show igmp-snooping router-dynamic**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>router-dynamic</b> Displays the dynamic route ports. |
| <b>Command Default</b>    | None  |
| <b>Command Modes</b>      | User EXEC<br>Privileged EXEC                            |

### Examples

The following example shows the output from **show igmp-snooping router-dynamic** command on an interface where IGMP Snooping is enabled:

```
Device# show igmp-snooping router-dynamic
  Port      VID     Age      Type
    e1/3      100    237    { QUERY }
Total Record: 1
```

# show igmp-snooping router-static

To display the static route ports on an interface or an a multicast VLAN, use the **show igmp-snooping router-static** command in the EXEC mode.

```
show igmp-snooping router-static [interface {channel-group channel-group-id | ethernet port} | vlan vlan-id]
```

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <b>router-static</b> Displays the static router ports.<br><b>channel-group-id</b> Displays the static ports for a LACP channel group. The range is 0-5.<br><b>vlan-id</b> Displays the static ports for Multicast VLANs. |
| <b>Command Default</b>    | None   |
| <b>Command Modes</b>      | User EXEC<br>Privileged EXEC   |

**Examples** The following example shows the output from **show igmp-snooping router-static** command on an interface where IGMP Snooping is enabled:

```
Device# show igmp-snooping router-static interface channel-group 1
      Port      VID      Age      Type
Total Record: 0
```

**show mld-snooping**

# show mld-snooping

To display information about MLD snooping related configuration, use the **show mld-snooping** command in privileged EXEC or global configuration mode.

## show mld-snooping

**Command Modes** Privileged EXEC (#)

Global configuration (config)

## Examples

This example shows how to view information about MLD snooping.

```
Device> enable
Device# configure terminal
Device(config)# show mld-snooping
Enable MLD-Snooping
The max response time is 10 second(s)
The host port timeout is 300 second(s).
Enable MLD-Snooping route-port forward
The Router port timeout is 300 second(s), Currently aging is running
Denied VLAN
Blocked list:
NULL
Allowed list:
NULL
Default group policy is permit
MLD-Snooping Querier : ON
Querier vlan : 101
Max Respond Time 25 sec | Query interval 60 sec
Port Information:

```

# show mld-snooping router-dynamic

To display the information of dynamic routing port, use the **show mld-snooping router-dynamic** command in privileged EXEC or global configuration mode.

**show mld-snooping router-dynamic**

**Command Modes** Privileged EXEC (#)

Global configuration (config)

**Examples** This example shows how to view information about dynamic routing port.

```
Device> enable
Device# configure terminal
Device(config)# show mld-snooping router-dynamic
  Port      VID      Age      Type
    e1/3      101      300    { QUERY }
Total Record: 1
```

**show mld-snooping router-static**

# show mld-snooping router-static

To display the information of static routing port, use the **show mld-snooping router-static** command in privileged EXEC or global configuration mode.

**show mld-snooping router-static****Command Modes** Privileged EXEC (#)

Global configuration (config)

**Examples**

This example shows how to view information about static routing port.

```
Device> enable
Device# configure terminal
Device(config)# show mld-snooping router-static
  Port      VID      Age      Type
Total Record: 0
```

# show multicast mld-snooping

To display multicast information, use the **show multicast mld-snooping** command in privileged EXEC or global configuration mode.

**show multicast mld-snooping interface { ethernet | gpon } slot-num/port-num**

|                           |                          |   |
|---------------------------|--------------------------|---|
| <b>Syntax Description</b> | <i>slot-num/port-num</i> | The port ID.<br><ul style="list-style-type: none"> <li>• <i>slot-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The value is 0.</li> <li>• GE Ethernet: The value is 1.</li> <li>• 10GE Ethernet: The value is 2.</li> </ul> </li> <li>• <i>port-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The range is from 1 to 8.</li> <li>• GE Ethernet: The range is from 1 to 4.</li> <li>• 10GE Ethernet: The range is from 1 to 2</li> </ul> </li> </ul> |
|---------------------------|--------------------------|---|

**Command Modes** Privileged EXEC (#)

Global configuration (config)

**Examples** This example shows how to view information about multicast.

```
Device> enable
Device# configure terminal
Device(config)# show multicast mld-snooping interface gpon 0/1
show mld-snooping multicast table information

**show multicast igmp-snooping**

## show multicast igmp-snooping

To display igmp-snooping multicast table information, use the **show multicast igmp-snooping** command in the EXEC mode.

**show multicast igmp-snooping {interface*interface-id* | ip-address *ip-address*}**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <i>interface-id</i> Displays the IGMP Snooping multicast table for the interface. |
|---------------------------|---|

|                   |  |
|-------------------|--|
| <i>ip-address</i> | Displays the IGMP Snooping multicast table for the IP address. |
|-------------------|--|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                              |
|----------------------|------------------------------|
| <b>Command Modes</b> | User EXEC<br>Privileged EXEC |
|----------------------|------------------------------|

|                 |  |
|-----------------|--|
| <b>Examples</b> | The following example displays the output of the <b>show multicast igmp snooping</b> command for an interface: |
|-----------------|--|

```
Device# show multicast igmp-snooping interface ethernet 1/1
show igmp-snooping multicast table information Total Record: 0
```

# show ont multicast

To display information about the multicast learning table on an ONT, use the **show ont multicast** command in privileged EXEC or global configuration mode.

**show ont multicast slot-num/pon-num/ont-num [port port-id ]**

|                           |  |   |
|---------------------------|--|---|
| <b>Syntax Description</b> | <i>slot-num/pon-num/ont-num</i>  | The ONT ID.   |
|                           |  | <ul style="list-style-type: none"> <li>• <i>slot-num</i>: The slot number. The value is 0.</li> <li>• <i>pon-num</i>: The PON number. The range is from 1 to 24.</li> <li>• <i>ont-num</i>: The ONT number. The range is from 1 to 24.</li> </ul> |
|                           | <i>port-id</i>   | The ONT Ethernet port ID.<br>The range is from 1 to 24.   |
| <b>Command Modes</b>      | Privileged EXEC (#)<br>Global configuration (config)   |   |
| <b>Examples</b>           | This example shows how to view the information about the multicast learning table on an ONT. |   |

```
Device> enable
Device# configure terminal
Device(config)# show ont multicast 0/1/1
```

show running-config mld\_snooping

## show running-config mld\_snooping

To display the running MLD Snooping configuration, use the **show running-config mld\_snooping** command in the EXEC mode.

**show running-config mld\_snooping**

|                           |                              |  |
|---------------------------|------------------------------|--|
| <b>Syntax Description</b> | mld_snooping                 | Displays the running MLD snooping configuration. |
| <b>Command Default</b>    | None.                        |  |
| <b>Command Modes</b>      | User EXEC<br>Privileged EXEC |  |

The following example shows a sample output of the **show running-config mld\_snooping** command.

```
Device#show running-config mld_snooping
!
! [MLD_SNOOPING]
mld-snooping
mld-snooping route-port forward
mld-snooping query-max-respond 25
mld-snooping querier
mld-snooping querier-vlan 101
interface gpon 0/1
mld-snooping fast-leave
mld-snooping record-host
mld-snooping multicast vlan 1
exit
```

# alarm all-packets

To enable alarms on all ports, use the **alarm all-packets** command in global configuration mode.

To enable alarms on a specific port, use the **alarm all-packets** command in interface configuration mode.

**alarm all-packets**

**no alarm all-packets**

---

## Command Modes

Global configuration (config)

Interface configuration (config-if)

---

## Examples

The following example shows how to enable alarms on all ports of the device:

```
Device> enable
Device# configure terminal
Device(config)# alarm all-packets
Enable port alarm successfully.
```

alarm all-packets threshold

# alarm all-packets threshold

To configure the port threshold information for alarms, use the **alarm all-packets threshold** command in interface configuration mode.

**alarm all-packets threshold {normal *normal-value* | exceed *exceed-value*}**

|                           |  |  |
|---------------------------|--|--|
| <b>Syntax Description</b> | <b>normal <i>normal-value</i></b><br><b>exceed <i>exceed-value</i></b> | Sets the minimum port bandwidth utilization threshold for the port.<br>Sets the maximum port bandwidth utilization threshold for the port. |
|---------------------------|--|--|

|                      |  |
|----------------------|--|
| <b>Command Modes</b> | Interface configuration mode (config-if) |
|----------------------|--|

|                 |  |
|-----------------|--|
| <b>Examples</b> | The following example shows how to set the port thresholds using the <b>alarm all-packets threshold</b> command: |
|-----------------|--|

```
Device> enable
Device# configure terminal
Device(config)# interface gpon 0/1
Device(config-if-gpon-0/1)# alarm all-packets threshold exceed 34 normal 4
```

# alarm cpu

To enable CPU alarms, use the **alarm cpu** command in global configuration mode.

**alarm cpu**  
**no alarm cpu**

**Command Modes** Global configuration mode (config)

**Examples** The following example shows how to enable CPU alarms:

```
Device> enable
Device# configure terminal
Device(config)# alarm cpu
```

# alarm cpu threshold

To configure the threshold information for CPU alarms, use the **alarm cpu threshold** command in global configuration mode.

**alarm cpu threshold {busy *busy-value* | unbusy *unbusy-value*}**

---

|                           |                                   |   |
|---------------------------|-----------------------------------|---|
| <b>Syntax Description</b> | <b>busy <i>busy-value</i></b>     | Sets the minimum CPU utilization threshold. |
|                           | <b>unbusy <i>unbusy-value</i></b> | Sets the maximum CPU utilization threshold. |

---

|                      |                                    |
|----------------------|------------------------------------|
| <b>Command Modes</b> | Global configuration mode (config) |
|----------------------|------------------------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example shows how to set the CPU thresholds using the <b>alarm cpu threshold</b> command: |
|-----------------|---|

```
Device> enable
Device# configure terminal
Device(config)# alarm cpu threshold busy 63 unbusy 20
```

# buildrun mode

To configure the file execution mode, use the **buildrun mode** command in privileged EXEC mode.

**buildrun mode {continue | stop}**

|                           |                 |   |
|---------------------------|-----------------|---|
| <b>Syntax Description</b> | <b>continue</b> | Sets the execution mode to non-interruptible. |
|                           | <b>stop</b>     | Sets the execution mode to interruptible.     |

**Command Modes** Privileged EXEC (#)

**Examples** The following is an example of the **buildrun mode stop** command:

```
Device> enable  
Device# buildrun mode stop
```

**clear startup-config**

# clear startup-config

To clear the startup configuration, use the **clear startup-config** command in privileged EXEC mode.

**clear startup-config****Command Modes** Privileged EXEC (#)**Examples**

The following is an example of the **clear startup-config** command:

```
Device> enable  
Device# clear startup-config
```

# clock summer-time

To set the clock daylight savings time, use the **clock summer-time** command in global configuration mode.

**clock summer-time { daily | weekly } start-time**

| Syntax Description | <i>start-time</i> | Specifies the start time for daylight savings. The daylight savings time format must be entered in hour, minutes and, seconds (HH:MM:SS). |
|--------------------|-------------------|---|
|--------------------|-------------------|---|

| Command Modes | Global configuration mode (config) |
|---------------|------------------------------------|
|---------------|------------------------------------|

| Examples | The following example shows how to configure the daylight savings using the <b>clock summer-time</b> command:                           |
|----------|---|
|          | <pre>Device&gt; enable Device# configure terminal Device(config)# clock summer-time daily 00:00:00 2021/03/12 00:00:00 2021/11/05</pre> |

# clock timezone

To configure the system time zone, use the **clock timezone** command in global configuration mode.

**clock timezone *timezone-name hours-offset minutes-offset***  
**no clock timezone**

|                           |                                    |  |
|---------------------------|------------------------------------|--|
| <b>Syntax Description</b> | <i>timezone-name</i>               | Specifies the timezone to the SNTP client.                                   |
|                           | <i>hours-offset minutes-offset</i> | Specifies the hours and minutes offset from the timezone to the SNTP client. |

|                      |                                    |
|----------------------|------------------------------------|
| <b>Command Modes</b> | Global configuration mode (config) |
|----------------------|------------------------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example shows how to configure a timezone on the SNTP client using the <b>clock timezone</b> command: |
|-----------------|---|

```
Device> enable
Device# configure terminal
Device(config)# clock timezone ch 3 43
```

# copy running-config startup-config

To copy the current configuration to the flash config file, use the **copy running-config startup-config** command in privileged EXEC mode.

**copy running-config startup-config**

**Command Modes** Privileged EXEC (#)

**Examples** The following is an example of the **copy running-config startup-config** command:

```
Device> enable
Device# copy running-config startup-config
Startup config in flash will be updated, are you sure(y/n)? [n]
```

```
copy startup-config running-config
```

## copy startup-config running-config

To copy the startup configuration from the flash config file to the current configuration, use the **copy startup-config running-config** command in privileged EXEC mode.

```
copy startup-config running-config
```

---

**Command Modes**      Privileged EXEC (#)

---

**Examples**      The following is an example of the **copy startup-config running-config** command:

```
Device> enable  
Device# copy startup-config running-config  
Running config will be updated, are you sure(y/n) ? [n]
```

# load ftp

To download a file with the FTP server, use the **load ftp** command in privileged EXEC mode.

```
load {application | configuration | edfa | epld | keyfile {private | public} | ont-image | whole-bootrom}ftp
{inet | inet6}ftp-server-ip-address file-name ftp-username ftp-password
```

## Syntax Description

|                              |  |
|------------------------------|--|
| <b>application</b>           | Specifies the host file.                       |
| <b>configuration</b>         | Specifies the configuration file.              |
| <b>edfa</b>                  | Specifies the EDFA file.                       |
| <b>epld</b>                  | Specifies the EPLD file.                       |
| <b>keyfile</b>               | Specifies the SSH keyfile.                     |
| <b>private</b>               | Specifies the SSH private keyfile.             |
| <b>public</b>                | Specifies the SSH public keyfile.              |
| <b>ont-image</b>             | Specifies the ONT image file.                  |
| <b>whole-bootrom</b>         | Specifies the whole bootrom file.              |
| <b>inet</b>                  | Specifies IPv4 address family.                 |
| <b>inet6</b>                 | Specifies IPv6 address family.                 |
| <i>ftp-server-ip-address</i> | Specifies the IP address of the FTP server.    |
| <i>file-name</i>             | Specifies the name of the file to be uploaded. |
| <i>ftp-username</i>          | Specifies the user name of the FTP server.     |
| <i>ftp-password</i>          | Specifies the password of the FTP server.      |

## Command Modes

Privileged EXEC (#)

## Examples

The following example shows how to download a whole bootrom file with an FTP server using the **load ftp** command:

```
Device> enable
Device# load whole-bootrom tftp inet 10.23.13.1 bootrom1.bin
```

# load tftp

To download a file with the TFTP server, use the **load tftp** command in privileged EXEC mode.

```
load {application | configuration | edfa | epfd | keyfile {private | public} | ont-image | whole-bootrom}tftp {inet | inet6}tftp-server-ip-address file-name
```

|                               |  |
|-------------------------------|--|
| <b>Syntax Description</b>     |  |
| <b>application</b>            | Specifies the host file.                       |
| <b>configuration</b>          | Specifies the configuration file.              |
| <b>edfa</b>                   | Specifies the EDFA file.                       |
| <b>epfd</b>                   | Specifies the EPLD file.                       |
| <b>keyfile</b>                | Specifies the SSH keyfile.                     |
| <b>private</b>                | Specifies the SSH private keyfile.             |
| <b>public</b>                 | Specifies the SSH public keyfile.              |
| <b>ont-image</b>              | Specifies the ONT image file.                  |
| <b>whole-bootrom</b>          | Specifies the whole bootrom file.              |
| <b>inet</b>                   | Specifies IPv4 address family.                 |
| <b>inet6</b>                  | Specifies IPv6 address family.                 |
| <b>tftp-server-ip-address</b> | Specifies the IP address of the TFTP server.   |
| <b>file-name</b>              | Specifies the name of the file to be uploaded. |

|                      |                     |
|----------------------|---------------------|
| <b>Command Modes</b> | Privileged EXEC (#) |
|----------------------|---------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example shows how to download a whole bootrom file with a TFTP server using the <b>load tftp</b> command: |
|-----------------|---|

```
Device> enable
Device# load whole-bootrom tftp inet6 10:23::11:1 bootrom1.bin
```

# load xmodem

To download a file with the XMODEM, use the **load ftp** command in privileged EXEC mode.

**load {application | configuration | whole-bootrom}xmodem**

## Syntax Description

**application** Specifies the host file.

**configuration** Specifies the configuration file.

**whole-bootrom** Specifies the whole bootrom file.

## Command Modes

Privileged EXEC (#)

## Examples

The following example shows how to download a whole bootrom file with an XMODEM using the **load xmodem** command:

```
Device> enable  
Device# load whole-bootrom xmodem
```

**local fec**

# local fec

To enable the ONT uplink FEC, use the **local fec** command in line profile configuration mode. To disable the ONT uplink FEC, use the **no local fec** command.

**local fec****no local fec**

---

**Command Modes** Line profile configuration (deploy-profile-line)

---

**Examples** This example shows how to enable the ONT uplink FEC

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(config-profile-line)# aim 5
Device(config-profile-line-5)# local fec
```

# ntp access

To configure access control for Network Time Protocol (NTP) services, use the **ntp access** command in global configuration mode. To disable NTP settings, use the **no access** form of the command.

```
ntp access ip-address { permit | deny }
```

```
no ntp access ip-address { permit | deny }
```

## Syntax Description

**access ip-address** Specifies the control access for an IPv4 or IPv6 access list to the NTP services.

**permit** Permits the NTP services.

**deny** Denies the NTP services

## Command Modes

Global configuration (config)

## Examples

The following example shows how to enable NTP authentication using the **ntp access** command:

```
Device> enable
Device# configure terminal
Device(config)# ntp access 192.168.0.10 255.255.255.0 permit
```

# ntp authentication

To enable NTP authentication and configure NTP settings, use the **ntp authentication** command in global configuration mode. To disable NTP settings, use the **no** form of the command.

**ntp authentication authentication-keyid key\_id md5 key\_string**

**no ntp authentication authentication-keyid key\_id md5 key\_string**

|                           |   |
|---------------------------|---|
| <b>Syntax Description</b> | <b>authentication</b> Enables NTP authentication.<br><b>authentication-keyid key_id md5 key_string</b> Specifies an authentication key for a trusted NTP source.  |
|                           | <ul style="list-style-type: none"> <li>• <b>key_id</b>: The authentication key. The range is from 1 to 65535.</li> <li>• <b>md5</b>: Message Digest 5 (MD5) algorithm authentication support</li> <li>• <b>key_string</b>: Key value. The maximum length is 32 characters.</li> </ul> |

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following example shows how to enable NTP authentication using the <b>ntp authentication</b> command: |
|-----------------|---|

```
Device> enable
Device# configure terminal
Device(config)# ntp authentication
```

# ntp broadcast

To configure NTP broadcast mode, use the **ntp broadcast** command in interface configuration mode. To disable NTP settings, use the **no** form of the command.

```
ntp broadcast { server authentication-keyid key_id | client }
```

```
no ntp broadcast { server authentication-keyid key_id | client }
```

## Syntax Description

**authentication-keyid key\_id** Specifies an authentication key for a trusted NTP source.

*key\_id*: The authentication key. The range is from 1 to 65535.

## Command Modes

Interface configuration (config-if)

## Examples

The following example shows how to configure the NTP broadcast mode using **ntp broadcast** command:

```
Device> enable
Device# configure terminal
Device(config)# interface vlan-interface 1
Device(config-if-vlaninterface-1)# ntp broadcast server
```

**ntp disable**

# ntp disable

To disable NTP incoming packets, use the **ntp disable** command in interface configuration mode. To disable NTP settings, use the **no** form of the command.

**ntp disable****no ntp disable**

---

|                      |                                     |
|----------------------|-------------------------------------|
| <b>Command Modes</b> | Interface configuration (config-if) |
|----------------------|-------------------------------------|

---

**Examples**

The following example shows how to disable NTP incoming packets using the **ntp disable** command:

```
Device> enable
Device# configure terminal
Device(config)# interface vlan-interface 1
Device(config-if-vlaninterface-1)# ntp disable
```

# ntp max-dynamic-sessions

To configure maximum number of dynamic NTP sessions, use the **ntpmax-dynamic-sessions** command in global configuration mode. To disable NTP settings, use the **no** form of the command.

**ntp max-dynamic-sessions value**

**no ntp max-dynamic-sessions value**

| Syntax Description | max-dynamic-sessions<br><i>value</i> | Specifies the maximum number of dynamic sessions.<br><i>value</i> : The range is from 11 to 100. |
|--------------------|--------------------------------------|--|
|--------------------|--------------------------------------|--|

**Command Modes** Interface configuration (config-if)

**Examples** The following example shows how to configure maximum number of dynamic NTP sessions using the **ntp authentication** command:

```
Device> enable
Device# configure terminal
Device(config)# ntp max-dynamic-sessions 10
```

# ntp multicast

To configure NTP multicast mode, use the **ntp multicast** command in global configuration mode. To disable NTP settings, use the **no** form of the command.

```
ntp multicast { server authentication-keyid key_id | client }
```

```
no ntp multicast { server authentication-keyid key_id | client }
```

---

## Syntax Description

**authentication-keyid key\_id** Specifies an authentication key for a trusted NTP source.

*key\_id*: The authentication key. The range is from 1 to 65535.

---

## Command Modes

Interface configuration (config-if)

## Examples

The following example shows how to configure the NTP multicast mode using **ntp multicast** command:

```
Device> enable
Device# configure terminal
Device(config)# interface vlan-interface 1
Device(config-if-vlaninterface-1)# ntp multicast server
```

## ntp unicast peer

To configure synchronization to an NTP-configured peer device, use the **ntp unicast peer** command in global configuration mode. To disable NTP settings, use the **no** form of the command.

**ntp unicast peer ip-address [ authentication-keyid key\_id ]**

**no ntp unicast peer ip-address [ authentication-keyid key\_id ]**

| Syntax Description | <b>peer ip-address</b> Specifies the system clock to synchronize a peer or to be synchronized by a peer<br><i>ip-address</i> : IPv4 or IPv6 address of the peer device. |
|--------------------|---|
|--------------------|---|

| Command Modes | Global configuration (config) |
|---------------|-------------------------------|
|---------------|-------------------------------|

| Examples | The following example shows how to configure synchronization to an NTP-configured peer device using the <b>ntp unicast peer</b> command: |
|----------|--|
|----------|--|

```
Device> enable
Device# configure terminal
Device(config)# ntp unicast peer 192.168.0.10
```

# ntp unicast server

To configure client mode, use the **ntp unicast server** command in global configuration mode. To disable NTP settings, use the **no** form of the command.

**ntp unicast server ip-address [ authentication-keyid key\_id ]**

**no ntp unicast server ip-address [ authentication-keyid key\_id ]**

---

## Syntax Description

**serverip-address** Specifies the system clock to be synchronized by a time server.

*ip-address*: IPv4 or IPv6 address of the time server.

---

## Command Modes

Global configuration (config)

## Examples

The following example shows how to configure client mode using the **ntp unicast server** command:

```
Device> enable
Device# configure terminal
Device(config)# ntp unicast server 192.168.0.11
```

# show alarm all-packets

To display the port alarm information, use the **show alarm all-packets** command in global configuration mode or interface configuration mode.

**show alarm all-packets [interface *port-number*]**

|                           |  |                          |
|---------------------------|--|--------------------------|
| <b>Syntax Description</b> | <b>interface <i>port-number</i></b>  | Specifies the interface. |
| <b>Command Modes</b>      | Global configuration mode (config)<br>Interface configuration mode (config-if) |                          |
| <b>Examples</b>           | The following is a sample output of the <b>show alarm all-packets</b> command: |                          |

**show alarm cpu**

## show alarm cpu

To display the CPU alarm information, use the **show alarm all-packets** command in global configuration mode.

**show alarm cpu**

---

**Command Modes** Global configuration mode (config)

---

**Examples** The following is a sample output of the **show alarm cpu** command:

```
Device(config)# show alarm cpu
CPU status alarm : enable
CPU busy threshold(%) : 90
CPU unbusy threshold(%) : 85
CPU status : unbusy
```

# show clock

To display the system clock, use the **show clock** command in global configuration mode.

## show clock

### Command Modes

Global configuration mode (config)

### Examples

The following is a sample output of the **show clock** command:

```
Device> enable
Device# configure terminal
Device(config)# show clock
Mon 2020/4/30 04:25:07 CCT 08:00
```

**show ntp access**

## show ntp access

To display the NTP access configuration, use the **show ntp access** command in global configuration mode.

**show ntp access**

|                      |                                    |
|----------------------|------------------------------------|
| <b>Command Modes</b> | Global configuration mode (config) |
|----------------------|------------------------------------|

**Examples**

The following is a sample output of the **show ntp access** command:

```
Device> enable
Device# configure terminal
Device(config)# show ntp access
```

# show ntp authentication

To display NTP authentication configuration, use the **show ntp authentication** command in global configuration mode.

## show ntp authentication

|                      |                                    |
|----------------------|------------------------------------|
| <b>Command Modes</b> | Global configuration mode (config) |
|----------------------|------------------------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | The following is a sample output of the <b>show ntp authentication</b> command: |
|-----------------|---|

```
Device> enable
Device# configure terminal
Device(config)# show ntp authentication
```

**show ntp broadcast server**

# show ntp broadcast server

To display the NTP broadcast server configuration, use the **show ntp broadcast server** command in global configuration mode.

**show ntp broadcast server**

---

**Command Modes** Global configuration mode (config)

---

**Examples** The following is a sample output of the **show ntp broadcast server** command:

```
Device> enable
Device# configure terminal
Device(config)# show ntp broadcast server
```

# show ntp disable

To disable NTP configuration, use the **show ntp disable** command in global configuration mode.

**show ntp disable**

## Command Modes

Global configuration mode (config)

## Examples

The following is a sample output of the **show ntp disable** command:

```
Device> enable
Device# configure terminal
Device(config)# show ntp disable
```

show ntp max-dynamic-sessions

## show ntp max-dynamic-sessions

To display the maximum number of dynamic sessions, use the **show ntp max-dynamic-sessions** command in global configuration mode.

**show ntp max-dynamic-sessions**

**Command Modes** Global configuration mode (config)

**Examples** The following is a sample output of the **show ntp max-dynamic-sessions** command:

```
Device> enable
Device# configure terminal
Device(config)# show ntp max-dynamic-sessions
```

# show ntp multicast server

To display the NTP multicast server configuration, use the **show ntp multicast server** command in global configuration mode.

**show ntp multicast server**

**Command Modes** Global configuration mode (config)

**Examples** The following is a sample output of the **show ntp multicast server** command:

```
Device> enable
Device# configure terminal
Device(config)# show ntp multicast server
```

**show ntp sessions**

# show ntp sessions

To display the NTP session details, use the **show ntp sessions** command in global configuration mode.

**show ntp sessions**

**Command Modes** Global configuration mode (config)

**Examples** The following is a sample output of the **show ntp sessions** command:

```
Device> enable
Device# configure terminal
Device(config)# show ntp sessions
```

# show ntp status

To display the NTP status configuration, use the **show ntp status** command in global configuration mode.

## show ntp status

### Command Modes

Global configuration mode (config)

### Examples

The following is a sample output of the **show ntp status** command:

```
Device> enable
Device# configure terminal
Device(config)# show ntp status
```

**show ntp unicast peer**

## show ntp unicast peer

To display the NTP unicast peer configuration, use the **show ntp unicast peer** command in global configuration mode.

**show ntp unicast peer**

---

**Command Modes** Global configuration mode (config)

---

**Examples** The following is a sample output of the **show ntp unicast peer** command:

```
Device> enable
Device# configure terminal
Device(config)# show ntp unicast peer
```

# show ntp unicast server

To display the NTP unicast server configuration, use the **show ntp unicast server** command in global configuration mode.

**show ntp unicast server**

**Command Modes** Global configuration mode (config)

**Examples** The following is a sample output of the **show ntp unicast server** command:

```
Device> enable
Device# configure terminal
Device(config)# show ntp unicast server
```

**show running-config**

# show running-config

To display the current system configuration, use the **show running-config** command in the privileged EXEC mode or global configuration mode.

```
show running-config {module | interface {ethernet port-id | gpon port-id | loopback-interface
loopback-interface-number | vlan-interface vlan-id} }perlines lines-per-page
```

## Syntax Description

|   |   |
|---|---|
| <b>module</b>                                       | Specifies a module.                               |
| <b>interface</b>                                    | Specifies an interface.                           |
| <b>ethernet port-id</b>                             | Displays the ethernet port configuration.         |
| <b>gpon port-id</b>                                 | Displays the GPON port configuration.             |
| <b>loopback-interface loopback-interface-number</b> | Displays the loopback interface configuration.    |
| <b>vlan-interface vlan-id</b>                       | Displays the VLAN configuration.                  |
| <b>perlines lines-per-page</b>                      | Specifies the number of lines displayed per page. |

## Command Modes

Privileged EXEC (#)

Global configuration mode (config)

## Examples

The following is a sample output from the **show running-config interface vlan-interface** command:

```
Device> enable
Device# show running-config interface vlan-interface

Building configuration...
![vlan-interface 1]
ip address range 192.0.2.254 192.0.2.255
description interface1
![vlan-interface 100]
ip address 10.75.171.17 255.255.255.0
end
```

# show sntp client

To display SNTP client configurations, use the **show sntp client** command in global configuration mode.

## show sntp client

### Command Modes

Global configuration mode (config)

### Examples

The following is a sample output of the **show sntp client** command:

```
Device> enable
Device# configure terminal
Device(config)# show sntp client
Clock state : synchronized          Current mode : anycast
Use server : 192.168.1.99           State : idle
Server state : synchronized         Server stratum : 1
Retrans-times: 3                   Retrans-interval: 30s
Authenticate : enable              Authentication-key: 1
Poll interval : 1000s
Last synchronized time: THU NOV 26 09:22:25 2015
```

**show startup-config**

# show startup-config

To display the startup configuration, use the **show startup-config** command in the privileged EXEC mode or global configuration mode.

```
show startup-config {module | interface {ethernet port-id | gpon port-id | loopback-interface
loopback-interface-number | vlan-interface vlan-id}} {perlines lines-per-page}
```

| Syntax Description                                  |  |   |
|---|--|---|
| <b>module</b>                                       |  | Specifies a module.                               |
| <b>interface</b>                                    |  | Specifies an interface.                           |
| <b>ethernet port-id</b>                             |  | Displays the ethernet port configuration.         |
| <b>gpon port-id</b>                                 |  | Displays the GPON port configuration.             |
| <b>loopback-interface loopback-interface-number</b> |  | Displays the loopback interface configuration.    |
| <b>vlan-interface vlan-id</b>                       |  | Displays the VLAN configuration.                  |
| <b>perlines lines-per-page</b>                      |  | Specifies the number of lines displayed per page. |

**Command Modes** Privileged EXEC (#)

Global configuration mode (config)

## Examples

The following is a sample output from the **show startup-config interface ethernet** command:

```
Device> enable
Device# show startup-config interface ethernet

```

# sntp client

To enable SNTP client, use the **sntp client** command in global configuration mode.

**sntp client**

**no sntp client**

---

**Command Modes**

Global configuration mode (config)

---

**Examples**

The following example shows how to enable SNTP client:

```
Device> enable
Device# configure terminal
Device(config)# sntp client
```

**sntp client authenticate**

# sntp client authenticate

To enable authentication of time sources, use the **sntp client authenticate** command in global configuration mode.

**sntp client authenticate**  
**no sntp client authenticate**

**Command Modes** Global configuration mode (config)

**Examples** The following example shows how to enable SNTP client authentication using the **sntp client authenticate** command:

```
Device> enable  
Device# configure terminal  
Device(config)# sntp client authenticate
```

# sntp client authentication-key

To configure the password for authentication for trusted time sources, use the **sntp client authentication-key** command in global configuration mode.

```
sntp client authentication-key key-number md5 md5-key
no sntp client authentication-key key-number
```

## Syntax Description

|                           |   |
|---------------------------|---|
| <i>key-number</i>         | Specifies the authentication key for the SNTP client.     |
| <b>md5</b> <i>md5-key</i> | Specifies the MD5 authentication key for the SNTP client. |

## Command Modes

Global configuration mode (config)

## Examples

The following example shows how to configure SNTP client authentication using the **sntp client authentication-key** command:

```
Device> enable
Device# configure terminal
Device(config)# sntp client authentication-key 3 md5 5
```

**sntp client broadcastdelay**

# sntp client broadcastdelay

To configure the broadcast propagation delay for an SNTP client, use the **sntp client broadcastdelay** command in global configuration mode.

**sntp client broadcastdelay *delay-time***

|                           |                   |   |
|---------------------------|-------------------|---|
| <b>Syntax Description</b> | <i>delay-time</i> | Specifies the round-trip broadcast delay for the SNTP client in milliseconds. |
|---------------------------|-------------------|---|

|                      |                                    |
|----------------------|------------------------------------|
| <b>Command Modes</b> | Global configuration mode (config) |
|----------------------|------------------------------------|

## Examples

The following example show how to configure the delay time for the SNTP client using the **sntp client broadcastdelay** command:

```
Device> enable
Device# configure terminal
Device(config)# sntp client broadcastdelay 15
```

# sntp client mode

To configure the mode of function of the SNTP client, use the **sntp client mode** command in global configuration mode.

**sntp client mode {anycast {[key key-id]} | broadcast | multicast | unicast}**

|                           |                   |  |
|---------------------------|-------------------|--|
| <b>Syntax Description</b> | <b>anycast</b>    | Sets the SNTP client to work in anycast mode.      |
|                           | <b>key key-id</b> | Specifies the authentication key for anycast mode. |
|                           | <b>broadcast</b>  | Sets the SNTP client to work in broadcast mode.    |
|                           | <b>multicast</b>  | Sets the SNTP client to work in multicast mode.    |
|                           | <b>unicast</b>    | Sets the SNTP client to work in unicast mode.      |

**Command Modes** Global configuration mode (config)

**Examples** The following example show how to configure the SNTP client to unicast mode using the **sntp client mode** command:

```
Device> enable
Device# configure terminal
Device(config)# sntp client mode unicast
```

**sntp client poll-interval**

# sntp client poll-interval

To configure the polling interval for an SNTP client, use the **sntp client poll-interval** command in global configuration mode.

**sntp client poll-interval** *poll-interval-time*

|                           |                           |  |
|---------------------------|---------------------------|--|
| <b>Syntax Description</b> | <i>poll-interval-time</i> | Specifies the polling interval for the SNTP client in seconds. |
|---------------------------|---------------------------|--|

|                      |                                    |
|----------------------|------------------------------------|
| <b>Command Modes</b> | Global configuration mode (config) |
|----------------------|------------------------------------|

## Examples

The following example show how to configure the polling interval for the SNTP client using the **sntp client poll-interval** command:

```
Device> enable
Device# configure terminal
Device(config)# sntp client poll-interval 800
```

# sntp client retransmit-interval

To configure the timeout retransmission interval for an SNTP client, use the **sntp client retransmit-interval** command in global configuration mode.

**sntp client retransmit-interval** *retransmit-interval-time*

|                           |   |   |
|---------------------------|---|---|
| <b>Syntax Description</b> | <i>retransmit-interval-time</i>   | Specifies the timeout retransmission interval for the SNTP client in seconds.                             |
| <b>Command Modes</b>      | Global configuration mode (config)  |   |
| <b>Usage Guidelines</b>   | The configured timeout retransmission mechanism takes effect only when the SNTP client works in the unicast or anycast mode.                          |   |
| <b>Examples</b>           | The following example show how to configure the retransmission interval for the SNTP client using the <b>sntp client retransmit-interval</b> command: | <pre>Device&gt; enable Device# configure terminal Device(config)# sntp client retransmit-interval 8</pre> |

# sntp client retransmit

To configure the number of timeout retransmission attempts for an SNTP client, use the **sntp client retransmit** command in global configuration mode.

**sntp client retransmit** *number*

|                           |   |  |
|---------------------------|---|--|
| <b>Syntax Description</b> | <i>number</i>   | Specifies the number of timeout retransmission attempts for the SNTP client. |
| <b>Command Modes</b>      | Global configuration mode (config)  |  |
| <b>Usage Guidelines</b>   | The configured timeout retransmission mechanism takes effect only when the SNTP client works in the unicast or anycast mode.                                    |  |
| <b>Examples</b>           | The following example show how to configure the number of retransmission attempts for the SNTP client using the <b>sntp client retransmit-interval</b> command: |  |

```
Device> enable
Device# configure terminal
Device(config)# sntp client retransmit 5
```

# sntp client valid-server

To configure a legal server list for the SNTP client, use the **sntp client valid-server** command in global configuration mode.

```
sntp client valid-server ip-address wildcard-ip-address
no sntp client valid-server {all | ip-address wildcard-ip-address}
```

| Syntax Description         |   |
|----------------------------|---|
| <i>ip-address</i>          | Specifies the IP address of the valid SNTP server.    |
| <i>wildcard-ip-address</i> | Specifies the IP address of the wildcard SNTP server. |

**Command Modes** Global configuration mode (config)

## Examples

The following example shows how to configure the valid SNTP servers for an SNTP client using the **sntp client valid-server** command:

```
Device> enable
Device# configure terminal
Device(config)# sntp client valid-server 10.23.23.1 23.1.1.4
```

# sntp server

To set SNTP server configurations, use the **sntp server** command in global configuration mode.

**sntp server {ip-address | backup ip-address | key key-number}**

|                                 |   |
|---------------------------------|---|
| <b>Syntax Description</b>       |   |
| <i>ip-address</i>               | Specifies the IP address of the SNTP server.          |
| <b>backup</b> <i>ip-address</i> | Specifies the IP address of the SNTP backup server.   |
| <b>key</b> <i>key-number</i>    | Specifies the authentication key for the SNTP server. |

|                      |                                    |
|----------------------|------------------------------------|
| <b>Command Modes</b> | Global configuration mode (config) |
|----------------------|------------------------------------|

|                 |  |
|-----------------|--|
| <b>Examples</b> | The following example shows how to configure the SNTP server using the <b>sntp server</b> command: |
|-----------------|--|

```
Device> enable
Device# configure terminal
Device(config)# sntp server 12.2.2.1
```

# sntp trusted-key

To configure a trusted password for multicast and broadcast modes, use the **sntp trusted-key** command in global configuration mode.

```
sntp trusted-key key-number
no sntp trusted-key key-number
```

| Syntax Description | <i>key-number</i> | Specifies the trusted key for the SNTP client. |
|--------------------|-------------------|--|
|--------------------|-------------------|--|

| Command Modes | Global configuration mode (config) |
|---------------|------------------------------------|
|---------------|------------------------------------|

| Examples | The following example shows how to configure SNTP client trusted key authentication using the <b>sntp trusted-key</b> command: |
|----------|--|
|          | <pre>Device&gt; enable Device# configure terminal Device(config)# sntp trusted-key 243586</pre>                                |

**upload automatically configuration ftp**

## upload automatically configuration ftp

To automatically upload a configuration file at regular intervals with the FTP server, use the **upload automatically configuration ftp** command in privileged EXEC mode.

**upload automatically configuration ftp {inet | inet6}ftp-server-ip-address file-name ftp-username  
ftp-password per hours hours minutes minutes**

| Syntax Description                     |  |  |
|--|--|--|
| <b>inet</b>                            |  | Specifies IPv4 address family.   |
| <b>inet6</b>                           |  | Specifies IPv6 address family.   |
| <i>ftp-server-ip-address</i>           |  | Specifies the IP address of the FTP server.  |
| <i>file-name</i>                       |  | Specifies the name of the file to be uploaded.   |
| <i>ftp-username</i>                    |  | Specifies the user name of the FTP server.   |
| <i>ftp-password</i>                    |  | Specifies the password of the FTP server.  |
| <b>per hours hours minutes minutes</b> |  | Specifies the time interval in hours and minutes after which the configuration file is to be automatically uploaded. |

**Command Modes** Privileged EXEC (#)

### Examples

The following example shows how to upload a configuration file using the **upload automatically configuration tftp** command:

```
Device> enable
Device# upload automatically configuration ftp inet 10.23.13.1 config3.txt per hours 12
minutes 10
```

# upload automatically configuration tftp

To automatically upload a configuration file at regular intervals with the TFTP server, use the **upload automatically configuration tftp** command in privileged EXEC mode.

**upload automatically configuration tftp {inet | inet6}tftp-server-ip-address file-name per hours hours minutes minutes**

## Syntax Description

|  |  |
|--|--|
| <b>inet</b>                            | Specifies IPv4 address family.   |
| <b>inet6</b>                           | Specifies IPv6 address family.   |
| <i>tftp-server-ip-address</i>          | Specifies the IP address of the TFTP server.   |
| <i>file-name</i>                       | Specifies the name of the file to be uploaded.   |
| <b>per hours hours minutes minutes</b> | Specifies the time interval in hours and minutes after which the configuration file is to be automatically uploaded. |

## Command Modes

Privileged EXEC (#)

## Examples

The following example shows how to upload a configuration file using the **upload automatically configuration tftp** command:

```
Device> enable
Device# upload automatically configuration tftp inet 10.23.13.1 config2.txt per hours 20
minutes 30
```

# upload ftp

To upload a file with the FTP server, use the **upload ftp** command in privileged EXEC mode.

```
upload {application | configuration | keyfile {private | public} | logging}ftp {inet | inet6}ftp-server-ip-address file-name ftp-username ftp-password
```

|                              |  |
|------------------------------|--|
| <b>Syntax Description</b>    |  |
| <b>application</b>           | Specifies the host file.                       |
| <b>configuration</b>         | Specifies the configuration file.              |
| <b>keyfile</b>               | Specifies the SSH keyfile.                     |
| <b>private</b>               | Specifies the SSH private keyfile.             |
| <b>public</b>                | Specifies the SSH public keyfile.              |
| <b>logging</b>               | Specifies the log file.                        |
| <b>inet</b>                  | Specifies IPv4 address family.                 |
| <b>inet6</b>                 | Specifies IPv6 address family.                 |
| <i>ftp-server-ip-address</i> | Specifies the IP address of the FTP server.    |
| <i>file-name</i>             | Specifies the name of the file to be uploaded. |
| <i>ftp-username</i>          | Specifies the user name of the FTP server.     |
| <i>ftp-password</i>          | Specifies the password of the FTP server.      |

**Command Modes** Privileged EXEC (#)

## Examples

The following example shows how to upload a host file with an FTP server using the **upload ftp** command:

```
Device> enable
Device# upload application ftp 192.168.1.99 host.arj rr 142
```

# upload tftp

To upload a file with the TFTP server, use the **upload tftp** command in privileged EXEC mode.

```
upload {application | configuration | keyfile {private | public} | logging}tftp {inet | inet6}tftp-server-ip-address file-name
```

|                               |  |
|-------------------------------|--|
| <b>Syntax Description</b>     |  |
| <b>application</b>            | Specifies the host file.                       |
| <b>configuration</b>          | Specifies the configuration file.              |
| <b>keyfile</b>                | Specifies the SSH keyfile.                     |
| <b>private</b>                | Specifies the SSH private keyfile.             |
| <b>public</b>                 | Specifies the SSH public keyfile.              |
| <b>logging</b>                | Specifies the log file.                        |
| <b>inet</b>                   | Specifies IPv4 address family.                 |
| <b>inet6</b>                  | Specifies IPv6 address family.                 |
| <b>tftp-server-ip-address</b> | Specifies the IP address of the TFTP server.   |
| <b>file-name</b>              | Specifies the name of the file to be uploaded. |

**Command Modes** Privileged EXEC (#)

## Examples

The following example shows how to upload a configuration file with a TFTP server using the **upload tftp** command:

```
Device> enable
Device# upload application tftp 192.168.1.99 text.txt
```

upload tftp

# alarm profile refer

To refer an alarm profile to a line profile, use the **alarm profile refer** command in line profile configuration mode.

**alarm profile refer {index\_num | name name}**

|                           |                                 |  |
|---------------------------|---------------------------------|--|
| <b>Syntax Description</b> | <i>index_num</i><br><i>name</i> | The alarm profile index number.<br>The range is from 1 to 127.<br>The alarm profile name.<br>The unit is string. The string length is from 1 to 127. |
|---------------------------|---------------------------------|--|

**Command Modes** Line profile configuration (deploy-profile-line)

**Examples** This example shows how to refer an alarm profile to a line profile

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# alarm profile refer 1
```

# clear ont-logging buffer

To clear the ont logging buffer, use the **clear ont-logging buffer** command in global configuration mode.

**clear ont-logging buffer {ont\_id\_list | all}**

|                           |                    |                      |
|---------------------------|--------------------|----------------------|
| <b>Syntax Description</b> | <i>ont_id_list</i> | The list of ONT IDs. |
|                           | <b>all</b>         | All ONTs.            |

**Command Modes** Global configuration (config)

**Examples** This example shows how to clear the ONT log buffering

```
Device> enable
Device# configure terminal
Device(config)# clear ont-logging buffer all
```

**local bandwidth egress**

# local bandwidth egress

To configure the ONT bandwidth egress, use the **local bandwidth egress port *port\_id* cir *cir* cbs *cbs* pir *pir* pbs *pbs*** command in line profile configuration mode. To disable the ONT bandwidth egress, use the **no local bandwidth egress port *port\_id*** command.

**local bandwidth egress port *port\_id* cir *cir* cbs *cbs* pir *pir* pbs *pbs***

**no local bandwidth egress port *port\_id***

|                           |  |   |
|---------------------------|--|---|
| <b>Syntax Description</b> |  |   |
| <b><i>port_id</i></b>     |  | The ONT Ethernet port ID. The range is from 1 to 24.  |
| <b><i>cir cir</i></b>     |  | The committed information rate in kbps. The value range is from                                   |
| <b><i>cbs cbs</i></b>     |  | The committed burst size in KB. The value range is from 2 to 32000.                               |
| <b><i>pir pir</i></b>     |  | The peak information rate in kbps. The value range is from 64 to is greater than or equal to CIR. |
| <b><i>pbs pbs</i></b>     |  | The peak burst size in KB. The value range is from 2 to 32000.                                    |

**Command Modes** Line profile configuration (deploy-profile-line)

## Examples

This example shows how to configure the ONT bandwidth egress.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# local bandwidth egress port 3 cir 200 cbs 70 pir 1024 pbs
90
```

# local loop-detect

To enable local loop-detect, use the **local loop-detect** command in line profile configuration mode. To disable local loop-detect, use the **no local loop-detect** command.

**local loop-detect**

**no local loop-detect**

**Command Modes** Line profile configuration (deploy-profile-line)

**Examples** This example shows how to enable local loop-detect

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# local loop-detect
```

# local mac-address-table

To configure the ONT maximum MAC count, use the **local mac-address-table** command in line profile configuration mode. To disable the ONT maximum MAC count, use the **no local mac-address-table** command.

**local mac-address-table max-mac-count *max\_mac\_count* [port *port\_id*]**

**no local mac-address-table**

|                           |                      |   |
|---------------------------|----------------------|---|
| <b>Syntax Description</b> | <i>max_mac_count</i> | The maximum MAC address learning capacity.            |
|                           |                      | The range is from 1 to 255.                           |
|                           | <i>port_id</i>       | The ONT Ethernet port ID. The range is from 1 to 255. |

|                      |  |
|----------------------|--|
| <b>Command Modes</b> | Line profile configuration (deploy-profile-line) |
|----------------------|--|

|                 |  |
|-----------------|--|
| <b>Examples</b> | This example shows how to configure the ONT maximum MAC count. |
|-----------------|--|

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# local mac-address-table max-mac-count 12
```

# local neg-mode

To configure the local Ethernet speed and duplex, use the **local neg-mode speed *speed* duplex *duplex\_mode* port *port\_id*** command in unique profile configuration mode.

**local neg-mode speed *speed* duplex *duplex\_mode* port *port\_id***

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <p><i>speed</i></p> <p>The ONT Ethernet port rate mode.<br/>The options are</p> <ul style="list-style-type: none"> <li>• 10M</li> <li>• 100M</li> <li>• 1000M</li> <li>• Auto-negotiation</li> </ul>       |

## Command Modes

Unique profile configuration (deploy-profile-unique)

## Examples

This example shows how to configure the local Ethernet speed and duplex

```
Device> enable
Device# configure terminal
Device(config)# deploy profile unique
Device(deploy-profile-unique)# aim 0/1/1
Device(deploy-profile-unique-0/1/1)# local neg-mode speed 10 duplex half port 3
```

**local ranging-balance**

# local ranging-balance

To configure ONT range compensation, use the **local ranging-balance** command in unique profile configuration mode. To disable the ONT range compensation, use the **no local ranging-balance** command.

**local ranging-balance {decrease | increase}balance\_length**

**no local ranging-balance**

|                           |                       |   |
|---------------------------|-----------------------|---|
| <b>Syntax Description</b> | <b>decrease</b>       | Decreases the range compensation.   |
|                           | <b>increase</b>       | Increases the range compensation.   |
|                           | <i>balance_length</i> | The ONT ranging compensation value<br>The unit is meters. The range is from 1 to 1000 |

**Command Modes** Unique profile configuration (deploy-profile-unique)

**Examples** This example shows how to increase ONT range compensation

```
Device> enable
Device# configure terminal
Device(config)# deploy profile unique
Device(deploy-profile-unique)# aim 0/1/1
Device(deploy-profile-unique-0/1/1)# local ranging-balance increase 2000
```

# local shutdown

To configure the ONT local shutdown, use the **local shutdown** command in unique profile configuration mode. To disable the ONT local shutdown, use the **no local shutdown** command.

**local shutdown {port *port\_id* | catv-port *catv\_port\_id*}**

**no local shutdown {port *port\_id* | catv-port *catv\_port\_id*}**

|                           |                     |   |
|---------------------------|---------------------|---|
| <b>Syntax Description</b> | <i>port_id</i>      | The ONT Ethernet UNI.<br>The value range is from 1 to 24.   |
|                           | <i>catv_port_id</i> | The ONT RF interface ID.<br>The value range is from 1 to 4. |

**Command Modes** Unique profile configuration (deploy-profile-unique)

**Examples** This example shows how to configure the ONT local shutdown.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile unique
Device(deploy-profile-unique)# aim 0/1/1
Device(deploy-profile-unique-0/1/1)# local shutdown port 2
```

**local switch**

# local switch

To enable the ONT local switching, use the **local switch** command in line profile configuration mode. To disable the ONT local switching, use the **no local switch** command.

**local switch****no local switch**

---

**Command Modes** Line profile configuration (deploy-profile-line)

---

**Examples** This example shows how to enable the ONT local switching.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile line
Device(deploy-profile-line)# aim 5
Device(deploy-profile-line-5)# local switch
```

# ont-logging

To enable ONT logging, use the **ont-logging** command in global configuration mode. To disable ONT logging, use the **no ont-logging** command.

**ont-logging**

**no ont-logging**

**Command Modes** Global configuration (config)

**Examples** This example shows how to enable ONT logging.

```
Device> enable
Device# configure terminal
Device(config)# ont-logging
```

# ont-logging buffer

To save the ONT log to a buffer, use the **ont-logging buffer** command in global configuration mode. To disable the ONT logging buffer, use the **no ont-logging buffer** command.

**ont-logging buffer {ont\_id\_list | all}**

**no ont-logging buffer**

---

## Syntax Description

|                    |                      |
|--------------------|----------------------|
| <i>ont_id_list</i> | The list of ONT IDs. |
| <b>all</b>         | All ONTs.            |

---

## Command Modes

Global configuration (config)

## Examples

This example shows how to enable the ONT log buffering.

```
Device> enable
Device# configure terminal
Device(config)# ont-logging buffer all
```

# ont-logging monitor

To enable monitor for ONT logs, use the **ont-logging monitor** command in global configuration mode. To disable monitor for ONT logs, use the **no ont-logging monitor** command.

**ont-logging monitor** {monitor\_number | all} {ont\_id\_list | all}

**no ont-logging monitor** {monitor\_number | all} {ont\_id\_list | all}

| Syntax Description | Parameter             | Description  |
|--------------------|-----------------------|--|
|                    | <i>monitor_number</i> | The monitor number.<br>The range is from 0 to 5, where 0 is the con- |
|                    | <i>ont_id_list</i>    | The list of ONT IDs.   |
|                    | <b>all</b>            | All ONTs.  |

**Command Modes** Global configuration (config)

**Examples** This example shows how to enable the ONT log monitor

```
Device> enable
Device# configure terminal
Device(config)# ont-logging monitor all all
```

# ont-logging prefix

To configure log prefixes, use the **ont-logging prefix** command in global configuration mode. To disable log prefixing, use the **no ont-logging prefix** command.

**ont-logging prefix {ontid | sn}**

**no ont-logging prefix**

| Syntax Description | ontid | The ONT IDs.           |
|--------------------|-------|------------------------|
|                    | sn    | The ONT serial number. |

**Command Modes** Global configuration (config)

**Examples** This example shows how to enable the ONT log prefixing

```
Device> enable
Device# configure terminal
Device(config)# ont-logging prefix ontid
```

# ont-logging timestamps

To enable log timestamps of an ONT, use the **ont-logging timestamps** command in global configuration mode.

**ont-logging timestamps {uptime | notime | datetime}**

|                           |                 |  |
|---------------------------|-----------------|--|
| <b>Syntax Description</b> | <b>uptime</b>   | Configures logging with uptime duration. |
|                           | <b>notime</b>   | Configures logging with no time.         |
|                           | <b>datetime</b> | Configures logging with date and time    |

**Command Modes** Global configuration (config)

**Examples** This example shows how to enable log timestamps of an ONT

```
Device> enable
Device# configure terminal
Device(config)# ont-logging timestamps datetime
```

# ont active

To activate the ONT, use the **ont active** *ont\_id\_list* command in global configuration mode.

**ont active** *ont\_id\_list*

| <b>Syntax Description</b> | <i>ont_id_list</i>   | The list of ONT IDs.   |         |             |                       |                      |
|---------------------------|--|--|---------|-------------|-----------------------|----------------------|
| <b>Command Modes</b>      | Global configuration (config)  |  |         |             |                       |                      |
| <b>Examples</b>           | This example show how to activate the ONT.   |  |         |             |                       |                      |
|                           |  | <pre>Device&gt; enable Device# configure terminal Device(config)# ont active 0/1/1 Config success: 1, failed: 0.</pre> |         |             |                       |                      |
| <b>Related Commands</b>   | <table border="1"> <thead> <tr> <th>Command</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><b>ont deactivate</b></td> <td>Deactivates the ONT.</td> </tr> </tbody> </table> |  | Command | Description | <b>ont deactivate</b> | Deactivates the ONT. |
| Command                   | Description  |  |         |             |                       |                      |
| <b>ont deactivate</b>     | Deactivates the ONT.   |  |         |             |                       |                      |

# ont deactivate

To deactivate the ONT, use the **ont deactivate** *ont\_id\_list* in global configuration mode.

**ont deactivate** *ont\_id\_list*

|                           |                    |                      |
|---------------------------|--------------------|----------------------|
| <b>Syntax Description</b> | <i>ont_id_list</i> | The list of ONT IDs. |
|---------------------------|--------------------|----------------------|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

|                 |  |
|-----------------|--|
| <b>Examples</b> | This example show how to deactivate the ONT. |
|-----------------|--|

```
Device> enable
Device# configure terminal
Device(config)# ont deactivate 0/1/1
Config success: 1, failed: 0.
```

| Related Commands | Command           | Description        |
|------------------|-------------------|--------------------|
|                  | <b>ont active</b> | Activates the ONT. |

**ont neg-mode**

## ont neg-mode

To configure the ONT speed and duplex, use the **ont neg-mode speed *speed* duplex *duplex\_mode* slot-num/pon-num/ont-num port *port\_id*** command in global configuration mode.

**ont neg-mode speed *speed* duplex *duplex\_mode* slot-num/pon-num/ont-num port *port\_id***

---

### Syntax Description

*speed*

The ONT Ethernet port rate mode.

The options are

- 10M
- 100M
- 1000M
- Auto-negotiation

*duplex\_mode*

The ONT Ethernet port duplex mode.

The options are

- Full-duplex
- Half-duplex
- Auto-negotiation

*slot-num/pon-num/ont-num*

The ONT ID.

- *slot-num*: The slot number. The value is 0.
- *pon-num*: The PON number. The range is from 1 to 16.
- *ont-num*: The ONT number. The range is from 1 to 32.

*port\_id*

The ONT Ethernet port ID. The range is from 1 to 32.

---

### Command Modes

Global configuration (config)

---

### Examples

This example shows how to configure the ONT speed and duplex.

```
Device> enable
Device# configure terminal
Device(config)# ont neg-mode speed 10 duplex half 0/1/1 port 3
```

# ont reboot

To reboot an ONT port, use the **ont reboot** command in global configuration mode.

**ont reboot** *slot-num/pon-num/ont-num*

| Syntax Description | <i>slot-num/pon-num/ont-num</i>               | The ONT ID.<br><ul style="list-style-type: none"><li>• <i>slot-num</i>: The slot number. The value is 0.</li><li>• <i>pon-num</i>: The PON number. The range is from 0 to 15.</li><li>• <i>ont-num</i>: The ONT number. The range is from 1 to 32.</li></ul> |
|--------------------|---|--|
| Command Modes      | Global configuration (config)                 |  |
| Examples           | This example shows how to reboot an ONT port. | <pre>Device&gt; enable Device# configure terminal Device(config)# ont reboot 0/1/1</pre>   |

**ont shutdown**

## ont shutdown

To configure the ONT shutdown, use the **ont shutdown** command in global configuration mode. To disable ONT shutdown, use the **no ont shutdown** command.

**ont shutdown** *slot-num/pon-num/ont-num port port\_id*

**no ont shutdown** *slot-num/pon-num/ont-num port port\_id*

|                           |                                 |   |
|---------------------------|---------------------------------|---|
| <b>Syntax Description</b> | <i>slot-num/pon-num/ont-num</i> | The ONT ID.   |
|                           |                                 | <ul style="list-style-type: none"> <li>• <i>slot-num</i>: The slot number. The value is 0.</li> <li>• <i>pon-num</i>: The PON number. The range is from 1 to 16.</li> <li>• <i>ont-num</i>: The ONT number. The range is from 1 to 24.</li> </ul> |

---

|                |  |
|----------------|--|
| <b>port_id</b> | The ONT Ethernet port ID. The range is from 1 to 24. |
|----------------|--|

|                      |                               |

| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

|                 |   |
|-----------------|---|
| <b>Examples</b> | This example shows how to configure the ONT shutdown. |
|-----------------|---|

```
Device> enable
Device# configure terminal
Device(config)# ont shutdown 0/1/1 port 1
```

# ont upgrade

To configure an ONT for reboot, use the **ont upgrade** command in global configuration mode.

```
ont upgrade {auto-reboot|manual-reboot} {slot-num/pon-num/ont-num|{exclude | include}|{device-type device_type|software-version version}|sn|{string-hex string_serial_number|hex hex_serial_number}}
```

|                           |                                 |   |
|---------------------------|---------------------------------|---|
| <b>Syntax Description</b> | <b>auto-reboot</b>              | Automatically reboots the ONT.  |
|                           | <b>manual-reboot</b>            | Manually reboots the ONT  |
|                           | <b>slot-num/pon-num/ont-num</b> | The ONT ID. <ul style="list-style-type: none"> <li>• <i>slot-num</i>: The slot number. The</li> <li>• <i>pon-num</i>: The PON number. Th</li> <li>• <i>ont-num</i>: The ONT number. Th</li> </ul> |
|                           | <b>exclude</b>                  | Excludes the ONT.   |
|                           | <b>include</b>                  | Includes the ONT.   |
|                           | <b>device-type device_type</b>  | The device identifier.  |
|                           | <b>software-version version</b> | The software identifier.  |
|                           | <b>hex_serial_number</b>        | The ONT serial number in Hex.   |
|                           | <b>string_serial_number</b>     | The ONT serial number in string.  |

**Command Modes** Global configuration (config)

## Examples

This example shows how to configure an ONT for auto reboot

```
Device> enable
Device# configure terminal
Device(config)# ont upgrade auto-reboot 0/1/1
```

**optical power rx threshold**

# optical power rx threshold

To configure the threshold of the receive optical power, use the **optical power rx threshold** command in alarm profile configuration mode. To delete the threshold, use the **no optical power rx threshold** command.

**optical power rx threshold {high *high\_rx\_power* | low *low\_rx\_power*}**

**no optical power rx threshold**

|                           |                      |  |
|---------------------------|----------------------|--|
| <b>Syntax Description</b> | <i>high_rx_power</i> | The highest threshold value. The value must be a number. |
|                           |                      | The unit is dBm. The range is from -127.0 to 127.0.      |
|                           | <i>low_rx_power</i>  | The lowest threshold value. The value must be a number.  |
|                           |                      | The unit is dBm. The range is from -127.0 to 127.0.      |

|                      |  |
|----------------------|--|
| <b>Command Modes</b> | Alarm profile configuration (deploy-profile-alarm) |
|----------------------|--|

## Examples

This example shows how to configure the high threshold value of the receive optical power.

```
Device> enable
Device# configure terminal
Device(config)# deploy profile alarm
Device(deploy-profile-alarm)# aim 5
Device(deploy-profile-alarm-5)# optical power tx threshold high 10
```

# show ont-logging

To display the ONT logs, use the **show ont-logging** command in global configuration mode

**show ont-logging**

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

## Examples

This example shows how to view the ONT logs

```
Device> enable
Device# configure terminal
Device(config)# show ont-logging
logging state: on
logging timestamps: uptime
logging prefix: ontid:on; sn:on
logging buffer: 0/1/1-0/8/128
logging monitor:
  0: 0/1/1-0/8/128
  1: 0/1/1-0/8/128
  2: 0/1/1-0/8/128
  3: 0/1/2-0/8/128
  4: 0/1/1-0/8/128
  5: 0/1/1-0/8/128
```

**show ont-logging buffer**

# show ont-logging buffer

To display information about ONT logging buffer, use the **show ont-logging buffer** command in global configuration mode.

**show ont-logging buffer {slot-num/pon-num/ont-num | all}**

|                           |                                 |  |
|---------------------------|---------------------------------|--|
| <b>Syntax Description</b> | <i>slot-num/pon-num/ont-num</i> | The ONT ID.  |
|                           |                                 | <ul style="list-style-type: none"> <li>• <i>slot-num</i>: The slot number. The value is 0.</li> <li>• <i>pon-num</i>: The PON number. The range is from 1 to 16.</li> <li>• <i>ont-num</i>: The ONT number. The range is from 1 to 4.</li> </ul> |

|            |          |
|------------|----------|
| <b>all</b> | All ONTs |
|------------|----------|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

## Examples

This example shows how to view the information about ONT logging buffer

```
Device> enable
Device# configure terminal
Device(config)# show ont-logging buffer 0/1/1

# show ont mac-address-table

To display information about the MAC address table of an ONT, use the **show ont mac-address-table** command in global configuration mode.

**show ont mac-address-table** {*mac\_address* | *slot-num/pon-num/ont-num* | **interface gpon** {*slot-number/port-number* | **all**}}

## Syntax Description

|                                 |  |
|---------------------------------|--|
| <i>mac_address</i>              | The MAC address.   |
| <i>slot-num/pon-num/ont-num</i> | <p>The ONT ID.</p> <ul style="list-style-type: none"> <li>• <i>slot-num</i>: The slot number. The value is 0.</li> <li>• <i>pon-num</i>: The PON number. The range is from 1 to 8.</li> <li>• <i>ont-num</i>: The ONT number. The range is from 1 to 256.</li> </ul>   |
| <i>slot-number/port-number</i>  | <p>The port ID.</p> <ul style="list-style-type: none"> <li>• <i>slot-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The value is 0.</li> <li>• GE Ethernet: The value is 1.</li> <li>• 10GE Ethernet: The value is 2.</li> </ul> </li> <li>• <i>port-number</i>:           <ul style="list-style-type: none"> <li>• GPON: The range is from 1 to 8.</li> <li>• GE Ethernet: The range is from 1 to 4.</li> <li>• 10GE Ethernet: The range is from 1 to 2.</li> </ul> </li> </ul> |
| <b>all</b>                      | All ports.   |

## Command Modes

Global configuration (config)

## Examples

This example shows how to view information about the MAC address table of an ONT

```
Device> enable
Device# configure terminal
Device(config)# show ont mac-address-table interface gpon 0/1
MAC-Address      VID  ONT-ID  SN           ID/GEM
00:0a:5a:a7:01:34  100  0/1/5  GPON-5aa7012a  4/355
Total entries: 1.
```

**show ont port-status**

## show ont port-status

To display status information of an ONT port, use the **show ont port-status** command in global configuration mode.

```
show ont port-status slot-num/pon-num/ont-num { port port_id | catv-port catv_port_id | pots-port pots-number }
```

### Syntax Description

|                                 |  |
|---------------------------------|--|
| <i>slot-num/pon-num/ont-num</i> | The ONT ID. <ul style="list-style-type: none"> <li>• <i>slot-num</i>: The slot number. The value is 0.</li> <li>• <i>pon-num</i>: The PON number. The range is from 1 to 24.</li> <li>• <i>ont-num</i>: The ONT number. The range is from 1 to 4.</li> </ul> |
| <i>port_id</i>                  | The ONT Ethernet UNI.<br>The value range is from 1 to 24.  |
| <i>catv_port_id</i>             | The ONT RF interface ID.<br>The value range is from 1 to 4.  |
| <i>pots-number</i>              | Specifies the POTS port.<br>The value can be 1 or 2.   |

### Command Modes

Global configuration (config)

### Examples

This example shows how to view the status information of an ONT port.

```
Device> enable
Device# configure terminal
Device(config)# show ont port-status 0/1/5 port 2
Port status is Enable, Linkdown
```

# show ont statistics

To display statistical information about an ONT, use the **show ont statistics** command in global configuration mode.

```
show ont statistics slot-num/pon-num/ont-num {gem {broadcast | multicast | unicast gem_index } | {port port-id } | traffic}
```

## Syntax Description

|                                 |  |
|---------------------------------|--|
| <i>slot-num/pon-num/ont-num</i> | The ONT ID. <ul style="list-style-type: none"> <li>• <i>slot-num</i>: The slot number. The value is 0.</li> <li>• <i>pon-num</i>: The PON number. The range is from 1 to 24.</li> <li>• <i>ont-num</i>: The ONT number. The range is from 1 to 255.</li> </ul> |
| <b>gem</b>                      | Displays statistical information about GEM port.   |
| <b>broadcast</b>                | Displays statistical information about broadcast traffic.  |
| <b>multicast</b>                | Displays statistical information about multicast traffic.  |
| <b>unicast</b> <i>gem_index</i> | Displays statistical information about unicast packet traffic.<br><i>gem_index</i> : The GEM port index number. The range is from 0 to 255.  |
| <i>port-id</i>                  | The ONT Ethernet port ID.<br>The range is from 1 to 24.  |
| <b>traffic</b>                  | Displays statistical information about ONT uplink traffic.   |

## Command Modes

Global configuration (config)

## Examples

This example shows how to view the statistical information about an ONT.

```
Device> enable
Device# configure terminal
Device(config)# show ont statistics 0/1/1 port 1
Upstream frames : 0
Upstream bytes : 0
Downstream frames : 0
Downstream bytes : 0
Up traffic (kbps) : 0
Down traffic (kbps) : 0
```

**show ont upgrade-status**

## show ont upgrade-status

To display the ONT upgrade status, use the **show ont upgrade-status** command in global configuration mode.

**show ont upgrade-status {image | xml} {slot-num/pon-num/ont-num | all}**

|                           |  |
|---------------------------|--|
| <b>Syntax Description</b> | <p><i>slot-num/pon-num/ont-num</i></p> <p>The ONT ID.</p> <ul style="list-style-type: none"> <li>• <i>slot-num</i>: The slot number. The value is 0.</li> <li>• <i>pon-num</i>: The PON number. The range is from 1 to 16.</li> <li>• <i>ont-num</i>: The ONT number. The range is from 1 to 8.</li> </ul> |
|                           | <p><b>all</b></p> <p>All ports.</p>  |

**Command Modes** Global configuration (config)

**Examples** This example shows how to view the ONT upgrade status

```
Device> enable
Device# configure terminal
Device(config)# show ont upgrade-status image 0/1/1
ONT    Active-version Inactive-version Status
0/1/1 C01R544V00B09  C01R544V00B07      success
Total entries: 1.
```

# show ont version

To display an ONT version, use the **show ont version** command in global configuration mode.

**show ont version interface gpon {port\_list | all}**

|                           |                  |                |
|---------------------------|------------------|----------------|
| <b>Syntax Description</b> | <i>port_list</i> | The GPON port. |
|                           | <b>all</b>       | All ports.     |

**Command Modes** Global configuration (config)

## Examples

This example shows how to view an ONT version

```
Device> enable
Device# configure terminal
Device(config)# show ont version interface gpon 0/1
ONT      SN          Software-version      Firmware-version
0/1/1    GPON-5a946e77  B01D001P010/B01D001P008  N40-428-1
0/1/2    GPON-5a95efca C01R539V00B19/-          S40-401
0/1/3    GPON-5aa0e950  B01D001P010/B01D001P007  N40-428-1
0/1/4    GPON-5aa0e9e0  B01D001P007/B01D001P006  N40-428-1
0/1/5    GPON-5aa7012a  1.1.2.5/1.1.2.6        N40-428-1
Total entries: 5.
```

```
show ont version
```
